ABSTRACT

These teacher's materials for a seven-unit course were developed to help students develop technological literacy, career exploration, and problem-solving skills relative to the communication industries. The seven units include an overview of energy and power, principles of energy and power, power production and conversion, power transmission and storage, transportation systems, transportation technical subsystems, and future projections. The first section is designed to teach teachers how to use the materials and includes an explanation of instruccional elements, an instructional-task analysis for each unit, and a list of 24 references. The instructional elements for the units include objectives, suggested activities, information sheets, transparency masters, assignment sheets, job sheets, tests, and test answers. Some elements, such as the information sheets, include photographs, diagrams, and line drawings. (CML)

FOREWORD

Technology education/industrial arts instructors are being asked to make radical changes in their programs to reflect the radical changes in our technological society. Rapid change and the current clamor for educational reform have made it evident that improvements must be made to meet the needs of students who will compete in a world quite different from the one they are experiencing in the classrooms and laboratories.

We are at the point where we need to overhaul traditional industrial arts programs and bring new and emerging technologies into the curriculum. However, the lack of instructional materials to support this new curriculum effort has made it extremely difficult. Hopefully, the new MAVCC Technology Education Series will aid teachers in updating and revitalizing their programs.

The series begins with Exploring Technology Education, Level I, which is followed by four Level II books which individually explore the technology systems of communication, construction, manufacturing, and energy, power, and transportation.

The book you are holding, Exploring Energy, Power, and Transportation Technology, is one of the Level II publications in this series. It has been developed to give students technological literacy, career exploration, and problem-solving skills dealing with the energy, power, and transportation industries.

Every effort has been made to make this publication basic, readable, and by all means, usable. Three vital parts of instruction have been intentionally omitted from the publication; motivation, personalization, and localization. These areas are left to the individual instructors who should capitalize on them. Only then will these publications become a vital part of the teaching-learning process.

Harley Schlichting, Chairman Board of Directors Mid-America Vocational Curriculum Consortium Greg Pierce
Executive Director
Mid-America Vocational
Curriculum Consortium

ACKNOWLEDGEMENTS

Appreciation is extended to those individuals who contributed their time and talents in the development of Exploring Energy, Power, and Transportation Technology.

The conter is of this publication were planned and reviewed by the following members of the Mid-America Vocational Curriculum Consortium technology education committee:

Dr. Myron Bender Mr. Donovan Bowers

Mr. Steve Coffmen Dr. John Dugger

Dr. Thomas Eppler

Dr. John lley

Mr. Wayne Lang

Mr. William McCallister

Ms. Jean McEntire

Dr. Don Mitchell

Dr. Billy Windhem

Ms. Jimmie Wood

Mr. Gordon Young

Grand Forks, North Dakota

Fairview, Oklahoma Jefferson City, Missouri

Ames, Iowa

Natchitoches, Louisiana

Pittsburg, Kansas

Rapia City, South Dakota

Omaha, Nebraska Little Rock, Arkansas Weatherford, Oklahoma San Marcos, Texas Stillwater, Oklahoma

Aurora, Colorado

Special appreciation is extended to Dr. Kendail Starkweather of Reston, Virginia for representing the International Technology Education Association (ITEA) on this committee.

Gratitude is expressed to the employees of the Graphics Division of the Oklahoma State Department of Vocational-Technical Education for their assistance with the phototypesetting, artwork, pasteup, and printing of this text.

Thanks are also extended to Mary Kellum, MAVCC Publication Specialist, for her assistance with the editing of this book, as well as the coordination of the entire project.

USE OF THIS PUBLICATION

Instructional Units

Exploring Energy, Power, and Transportation Technology contains seven units of instruction. Each instructional unit includes some or all of the basic components of a unit of instruction; performance objectives, suggested activities for teachers and students, information sheets, assignment sheets, job sheets, visual aids, tests, and answers to the tests. Units are planned for more than one lesson or class period of instruction.

Careful study of each instructional unit by the teacher will help to determine:

- A. The amount of material that can be covered in each class period
- B. The skills which must be demonstrated
 - 1. Supplies needed
 - 2. Equipment needed
 - 3. Amount of practice needed
 - 4. Amount of class time needed for demonstrations
- C. Supplementary materials such as pamphlets or filmstrips that must be ordered
- D. Resource people who must be contacted

Objectives

Each unit of instruction is based on performance objectives. These objectives state the goals of the course, thus providing a sense of direction and accomplishment for the student.

Performance objectives are stated in two forms: unit objectives, stating the subject matter to be covered in a unit of instruction; and specific objectives, stating the student performance necessary to reach the unit objective.

Since the objectives of the unit provide direction for the teaching-learning process, it is important for the teacher and students to have a common understanding of the intent of the objectives. A limited number of performance terms have been used in the objectives for this curriculum to assist in promoting the effectiveness of the communication among all individuals using the materials.

Reading of the objectives by the student should be followed by a class discussion to answer any questions concerning performance requirements for each instructional unit.

Teachers should feel free to add objectives which will fit the material to the needs of the students and community. When teachers add objectives, they should remember to supply the needed information, assignment and/or job sheets, and criterion tests.

x 9

Suggested Activities for the Instructor

Each unit of instruction has a suggested activities sheet outlining steps to follow in accomplishing specific objectives. Duties of instructors will vary according to the particular unit; he vever, for best use of the material they should include the following: provide students with objective sheet, information sheet, assignment sheets, and job sheets; provide filmstrips, make transparencies, and arrange for resource materials and people; discuss unit and specific objectives and information sheet; give test. Teachers are encouraged to use any additional instructional activities and teaching methods to aid students in accomplishing the objectives.

Information Sheets

Information sheets provide content essential for meeting the cognitive (knowledge) objectives in the unit. The teacher will find that the information sheets serve as an excellent guide for presenting the background knowledge necessary to develop the skill specified in the unit objective.

Students should read the information sheets before the information is discussed in class. Students may take additional notes on the information sheets.

Transparency Masters

Transparency masters provide information in a special way. The students may see as well as hear the material being presented, thus reinforcing the learning process. Transparencies may present new information or they may reinforce information presented in the information sheets. They are particularly effective when identification is necessary.

Transparencies should be made and placed in the notebook where they will be immediately available for use. Transparencies direct the class's attention to the topic of discussion. They should be left on the screen only when topics shown are under discussion.

Assignment Sheets

Assignment sheets give direction to study and furnish practice for paper and pencil activities to develop the knowledge which is a necessary prerequisite to skill development. These may be given to the student for completion in class or used for homework assignments. Answer shouts are provided which may be used by the student and/or teacher for checking student progress.

Job Sheets

Job sheets are an important segment of each unit. The instructor should be able to demonstrate the skills outlined in the job sheets. Procedures outlined in the job sheets give direction to the skill being taught and allow both student and teacher to check student progress toward the accomplishment of the skill. Job sheets provide a ready outline for students to follow if they have missed a demonstration. Job sheets also furnish potential employers with a picture of the skills being taught and the performances which might reasonably be expected from a person who has had this training.

Test and Evaluation

Paper-pencil and performance tests have been constructed to measure student achievement of each objective listed in the unit of instruction, Individual test items may be pulled out and used as a short test to determine student achievement of a particular objective. This kind of testing may be used as a daily quiz and will help the teacher spot difficulties being encountered by students in their efforts to accomplish the unit objective. Test items for objectives added by the teacher should be constructed and added to the test.

Test Answers

Test answers are provided for each unit. These may be used by the teacher and/or student for checking student achievement of the objectives.

EXPLORING ENERGY, POWER, AND TRANSPORTATION TECHNOLOGY

INSTRUCTIONAL TASK ANALYSIS

PRACTICAL APPLICATION: What The Student Should Be Able to Do (Psychomotor) RELATED INFORMATION: What the Student Should Know (Cognitive)

UNIT I: OVERVIEW OF ENERGY AND POWER

- 1. Terms and definitions
- 2. Forms of energy
- 3. Classifications of energy sources
- 4. Early uses of energy
- 5. Present day uses of energy
- 6. Early sources of power
- 7. Simple machines
- 8. Complex machines
- 9. Conservation of resources
- 10. Reading a gas or electric meter

- 11. Read sample meters
- 12. Read home meter
- 13. Perform an energy audit

RELATED INFORMATION: What the Student Should Know (Cognitive)

UNIT II: PRINCIPLES OF ENERGY AND POWER

- 1. Terms and definitions
- 2. Types of power systems
- 3. Stages of power systems
- 4. Basic measuring systems
- 5. Basic units of measurement
- 6. Prefixes for changing metric base units
- 7. Units for measuring energy and power
- 8. Terms and definitions related to measuring mechanical power
- Terms and definitions related to measuring electrical power
- 10. Ohm's law in letter formula
- 11. Ohm's law in triangle expression
- 12. Calculate problems using the formula for work
- 13. Calculate problems using the formula for horsepower
- 14. Calculate problems using the formula for torque
- 15. Solve problems using Ohm's law
- Build and test a simple, low pressure steam turbine
- 17. Construct a wind rotor
- 18. Build an electric generator

RELATED INFORMATION: What the Student Should Know (Cognitive)

UNIT III: POWER PRODUCTION AND CONVERSION

- 1. Terms and definitions
- 2. Types of conversions
- 3. Common direct conversion systems
- 4. Common methods of converting energy
- 5. Conversion of electrical power
- 6. Classifications of engines
- 7. Types of external combustion engines
- 8. Types of internal combustion engines
- 9. Operations of two-stroke and fourstroke cycle gasoline engines
- 10. Parts of a basic internal combustion engine
- 11. Systems of an engine and their functions and parts
- 12. Safety rules to follow when working with engines
- 13. Check engine components for wear
- 14. Disassemble and reassemble a four cycle, one cylinder engine
- 15. Construct a solor battery

RELATED INFORMATION: What the Student Should Know (Cognitive)

UNIT IV: POWER TRANSMISSION AND STORAGE

- 1. Terms and definitions
- 2. Types of power systems
- 3. Devices for control and transmission of mechanical power
- 4. Transmission of electrical power
- 5. Devices for control of electrical power
- 6. Principles of hydraulics
- 7. Parts of a hydraulic system
- 8. Steps in the operation of hydraulics
- 9. Applications of hydraulic transmissions
- 10. Advantages of hydraulic systems
- 11. Connectors used in fluid power systems
- 12. Laws defining the principles of pneumatics
- 13. Parts of a pneumatic system
- 14. Applications of pneumatics
- 15. Terms and definitions related to robotics
- 16. Major catagories of jobs in industry that are well suited for robots
- 17. Principles of lasers
- 18. Classes of lasers

RELATED INFORMATION: What the Student Should Know (Cognitive)

- 19. Applications of lasers
- 20. Types of energy and their storage devices
- 21. Determine gear rotation
- 22. Design and build a robotic arm
- 23. Build a "big track" robot
- 24. Build a lemon battery

UNIT V: TRANSPORTATION SYSTEMS

- 1. Terms and definitions
- 2. Basic modes of transportation
- 3. Types of intermodal transportation
- 4. Types of on-site transportation
- 5. Highway transportation
- 6. Rail transportation
- 7. Types of railway vehicles
- 8. Types of commercial airlines
- 9. Basic types of airplanes
- 10. Parts of an airplane
- 11. Space transportation
- 12. U.S. space projects
- 13. Characteristics of the space shuttle
- 14. Basic vessels for water transportation
- 15. Basic parts of a ship
- 16. Uses of computers for transportation systems

xvii

RELATED INFORMATION: What the Student Should Know (Cognitive)

- 17. Select modes of transportation for given situations
- 18. Set up and operate a pipeline simulation

UNIT VI: TRANSPORTATION TECHNICAL SUBSYSTEMS

- 1. Terms and definitions
- 2. Types of transportation technical subsystems
- 3. Elements of propulsion
- 4. Types of suspension systems
- 5. Types of control systems
- 6. Guidance systems
- 7. Structural systems
- 8. Support systems
- 9. Identify technical subsystems
- 10. Design a model racer
- 11. Build a model racer

UNIT VII: FUTURE PROJECTIONS AND ENVIRONMENTAL IMPACT

- 1. Terms and definitions
- 2. Types of pollution
- 3. Pollution from fossil fuels
- 4. Other energy sources and their pollutions and environmental impacts
- 5. Ways to control pollution
- 6. Energy conservation measures

xviii

RELATED INFORMATION: What the Student Should Know (Cognitive)

- 7. Emerging transmission systems
- 8. Advances in transportation
- 9. Research trends in energy usage
- 10. Write a scenario of energy use in the 2500
- 11. Discuss the effect of a total absence of fossil fuels
- 12. Construct a model maglev train

OVERVIEW OF ENERGY AND POWER UNIT I

UNIT OBJECTIVE

After completion of this unit, the student should be able to identify simple and complex machines, read meters, and perform an energy audit. Competencies will be demonstrated by correctly performing the procedures in the assignment and job sheets and by scoring a minimum of 85 percent on the written test.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- 1. Match terms related to energy and power with the correct definitions.
- Match forms of energy with the correct descriptions.
- 3. Select true statements concerning the classifications of energy sources.
- 4. Discuss early uses of energy.
- 5. List present day uses of energy.
- 6. List three early sources of power.
- 7. Identify simple machines.
- 8. Identify complex machines.
- 9. Discuss conservation of resources within the technology systems.
- Complete statements concerning reading a gas or electric meter.
- 11. Read sample meters. (Assignment Sheet #1)

OBJECTIVE SHEET

- 12. Read home meter. (Assignment Sheet #2)
- 13. Demonstrate the ability to perform an energy audit. (Job Sheet #1)

OVERVIEW OF ENERGY AND POWER UNIT I

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Make transparencies from the transparency masters included with this unit.
- C. Provide students with objective sheet.
- D. Discuss unit and specific objectives.
- E. Provide students with information and assignment sheets.
- F. Discuss information and assignment sheets.

(NOTE: Use the transparencies to enhance the information as needed.)

- G. Provide students with job sheet.
- H. Discuss and demonstrate the procedure outlined in the job sheet.
- I. Integrate the following activities throughout the teaching of this unit:
 - 1. Use films listed on the following page to reinforce conservation.
 - 2. Have students build simple solar projects. Possible resources for project ideas are included on the following pages.
 - 3. Invite professionals from local utility companies to discuss careers and energy use.
 - 4. Visit local facilities for generating electricity and local use of alternative energies.
 - 5. Demonstrate the simple machines shown in the Information Sheet, Section VII.
 - 6. Make a display board of complex machines used today.
 - 7. Discuss energy needs from a historical perspective.
 - 8. Contact local power companies for slides and/or other audio-visual materials dealing with sources of energy and power for your area as well as new and alternative energy sources.
 - 9. Obtain and show pictures of heat losses from public service companies. Discuss ways to prevent or lessen heat loss.

REFERENCES USED IN DEVELOPING THIS UNIT

- 10. Discuss R-values of different materials such as glass, concrete, and wood, and compare their values.
- 11. Discuss differences in energy loss between insulated and uninsulated glass, doors, and walls,
- 12. Conduct a survey of the school to determine the amount of electricity used (in kilowatt hours). Check for wattage of lights, number of lights and hours used daily, and price per kilowatt hour; then calculate the amount of money spent on lighting the building and then for total electricity.
- 13. Discuss the advantages and disadvantages of the different energy sources. Discuss both environmental issues and economic issues.
- 14. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.
- J. Give test.

4

- K. Evaluate test.
- L. Reteach if necessary.

OVERVIEW OF ENERGY AND POWER UNIT I

INFORMATION SHEET

I. Terms and definitions

- A. Effort Force applied to the machine
- B. Energy The ability to do work, or the capacity to produce motion, heat, or light
- C. Four-stroke cycle engine An engine that requires four strokes of the piston to produce a single power stroke

(NOTE: The four strokes are intake, compression, power, and exhaust.)

D. Mechanical advantage (MA) — The increase in force that you gain from using a machine

- E. Power Energy or work per unit of time, or work accomplished in a given period of time
- F. Radiant energy A form of energy traveling as wave motion, such as rays from the sun

(NOTE: Radiant energy is a combination of heat and light energy. Radiant energy changes to heat when it strikes a solid object.)

- G. Resistance Force overcome by the machine
- H. R-value A rating given a material's resistance to passage of heat

(NOTE: A material with a high R-value is a good thermal insulator and is energy efficient.)

- Turbine Rotating device driven by wind or water that is used to provide power
- J. Two-stroke cycle engine A heat engine that requires two piston strokes to produce a single power stroke

(NOTE: The two strokes are compression and power.)

II. Forms of energy (Transparency 1)

A. Mechanical energy — The energy of motion

(NOTE: This is the most visible and common form of energy.)

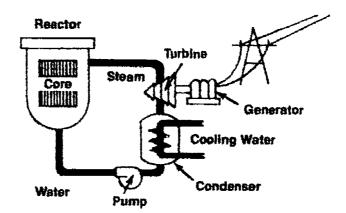

- B. Heat (thermal) energy The motion of molecules
 (NOTE: Heat is present whenever there is motion.)
- C. Light energy The visible part of radiant energy
- D. Chemical energy Energy produced by chemical changes
 (NOTE: It is the source of energy for all living things.)
- E. Electrical energy The motion of electrons
- F. Nuclear energy Energy produced by reactions in the nuclei of atoms
- III. Classifications of energy sources (Transparency 2)
 - A. Nonrenewable Energy sources that cannot be replaced once they are used
 - 1. Fossil fuels (hydrocarbons)
 - a. These are fuels that are derived from fossilized living things deposited *millions* of years ago.
 - b. Examples include natural gas, coal, and oil.
 - Natural gas (ethane, propane, butane, and methane) is used for heating, cooling, cooking, and generating electricity. It is the cleanest fossil fuel.
 - Coal can be burned for heating and as fuel for electrical power plants.
 - 3) Oil is primarily used for transportation fuels (gasoline, diesel) and for heating and generating electricity.

2. Uranium

a. Tremendous amounts of energy are released when the nucleus of uranium atoms are split.

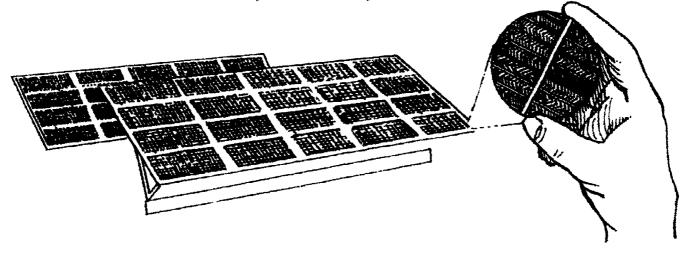

b. This energy is used in nuclear power plants to generate electricity for consumer use.

B. Renewable — Energy sources that can be used indefinitely if they are properly managed and maintained.

(NOTE: Most of the following energy sources are also referred to as alternative energies. They are being studied and developed as supplements and possible replacements for conventional energies such as fossil fuels. Although many applications have been developed, most are still not economically feasible for large scale use in all areas.)

- 1. Sun
 - a. Used in passive and active solar applications to heat homes and businesses and for natural sunlight.
 - b. Photovoltaic cells (solar cells) absorb sunlight and turn it directly into electricity.

Photovoltaic Modules

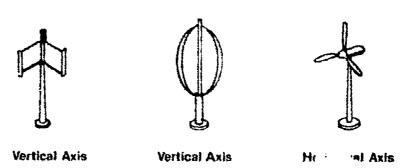

A Single-Crystal Silicon Solar Cell

- 2. Wind
 - a. Used naturally for sailing and drying and in windmills to mechanically grind grain and pump water.

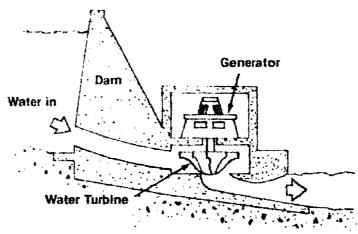

b. Presently being used in areas with steady winds to generate electricity through modern wind machines.

Types of Wind Machines

- 3. Water (Hydro) Primarily used to generate electrical. There are several forms of hydro energy.
 - a. Hydroelectric power The force of falling or flowing water in a river or stream is directed through a turbine, causing the turbine to spin. That rotates a generator which produces electricity. Often a dam is built across the river to build up the water supply and enable the power plant to generate even more electricity.

(NOTE: Hydroelectric power plants are very common in the U.S. and generate 1/n of all electricity produced here.)

 Ocean tides — The differences between high tide and low tide can be used to turn turbines and generate electricity in limited areas.

(NOTE: Ocean wave power caused by wind driving the water to the shore is also a possible source of energy in the future.)

4. Geothermal

a. Heat generated by natural processes beneath the earth's surface can be used for heat and for generating electric power.

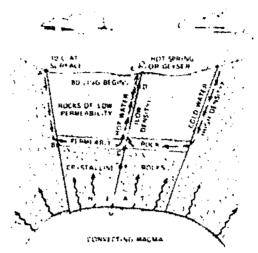

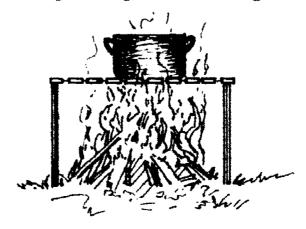

Diagram of a Geothermal Reservoir

- b. Natural examples of geothermal energy are volcanoes, hot springs, an geysers such as "Old Faithful" in Yellowstone National Pa.
- c. The largest commercial geothermal electric power plant complex is The Geysers in northern California. Other plants are currently in operation or under development in the western U.S. where geothermal reservoirs are found close to the earth's surface.
- 5. Plants and waste products (biomass conversion)
 - a. Trees, plants, farm crops, manure, seaweed, algae, sewage, and garbage can all be used as sources of energy.
 - b. These products can be burned and used as direct heat (trees) or converted into fuels such as alcohol, oil, and methane (waste products and trash) which can be used for transportation or to generate electricity.

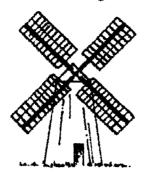

IV. Early uses of energy

A. Fire — Used for heating, cooking, and tool making

B. Wind — Used for sailing and windmilts

C. Water — Used in water wheels and turbines to grind grain and irrigate crops

D. Sun — Used for light and heat

- V. Present day uses of energy (Transparency 3)
 - A. Residential and commercial
 - 1. Lighting
 - 2. Heating and cooling
 - 3. Cooking
 - 4. Operating appliances and equipment
 - B. Industrial
 - 1. Mining
 - 2. Processing

- 3. Manufacturing materials into products
- 4. Generating electricity
- C. Transportation For fuel and movement

VI. Early sources of power

A. Humans — Depended upon their own muscles to hunt to ood, provide shelter, and protect themselves from their enemies

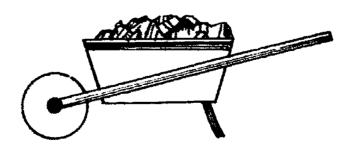

B. Animals — Some species could be tamed to provide another source of power to perform work

Examples: Oxen, horses, dogs

C. Simple machines — The earliest devices that enabled humans to do work that was difficult or impossible with muscle power alone

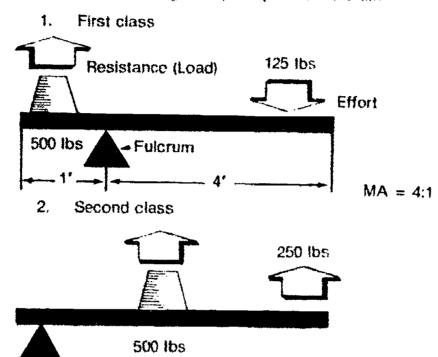

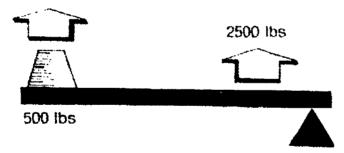

VII. Simple machines

(NOTE: The use of machines gives mechanical advantage over doing the task without the machine.)

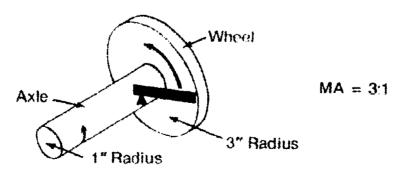

A. Lever — Bar resting on a pivot point or fulcrum

Third class

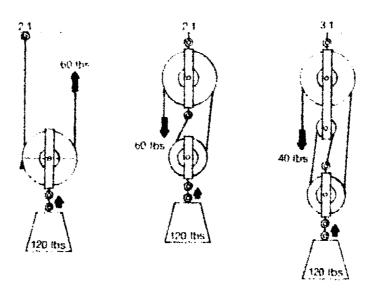

B. Wheel and take — Operates on the same principle as the lever; radius of the wheel acts as the lever, the center of the axle is the fulcrum.

(NOTE: The mechanical advantage of the wheel and axle is the ratio between the two lever arms. The mechanical advantage shown in the figure above is 3 to 1.)

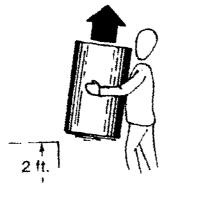

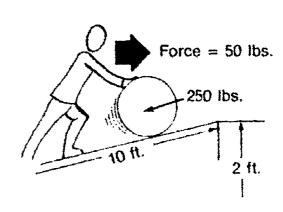

C. Pulley — A wheel that turns on an axis

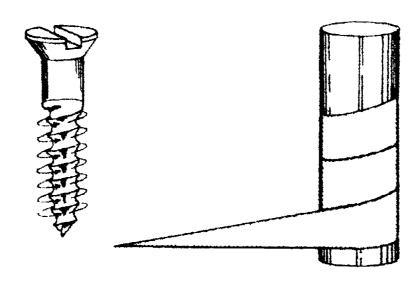

D. Inclined plane — Tapered surface along which somethings moves

Force = 150 lbs.

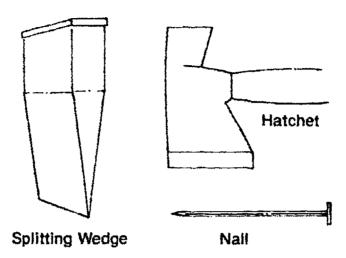

E. Screw — Spiral-shaped inclined plane wrapped around a rod

F. Wedge — Made up of two inclined planes placed so that the sloping sides come together at a point

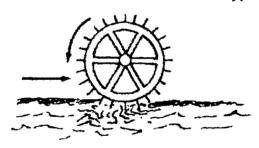

VIII. Complex machines

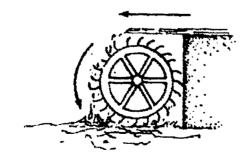

(NOTE: All complex machines use the principles of the simple machines singularly or in various combinations. The use of these machines helped bring about the Industrial Revolution.)

A. Waterwheel

1. Undershot waterwheel — The first type of waterwheel to be used

2. Overshot waterwheel — Used both the weight and the movement of water to produce power

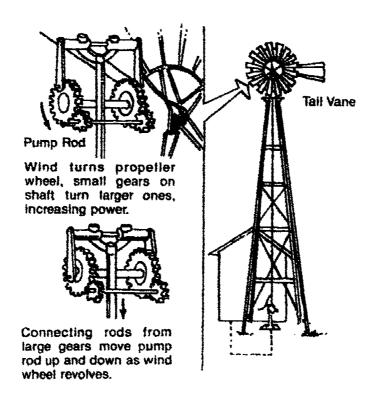

B. Water turbine — More efficient machine than the waterwheel, with increased power output

C. Windmills — Use the wind for power

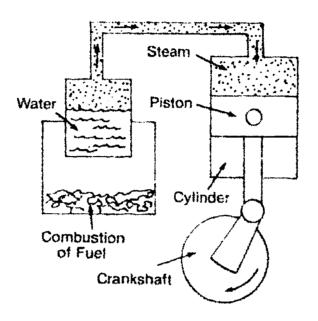

D. Engines

1. External combustion — Heat engine that uses heat and pressure produced outside of the engine.

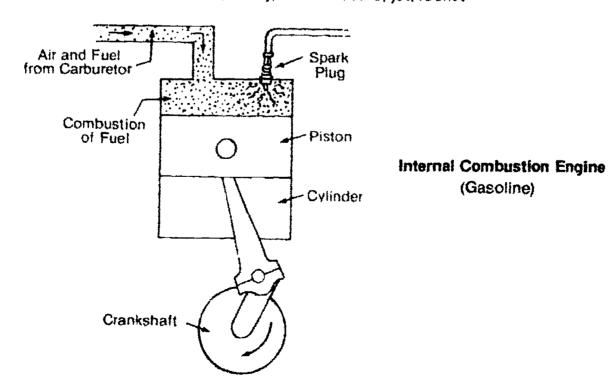

Examples: Steam engine, steam turbine, stirling cycle engine

External Combustion Engine (Steam Engine)

2. Internal combustion — A heat engine in which the heat and pressure are produced inside the engine.

Examples: Gasoline piston (two-stroke and four-stroke cycle), diesel, rotary, diesel-electric, jet, rocket

IX. Conservation of resources within the technology systems

(NOTE: When learning about energy, power, and transportation technology, it is important to understand the problems as well as the benefits of the technology. One of the problems is that most common fuels are limited and exhaustible and must be conserved.)

A. Transportation

- 1. Design and use more efficient engines.
- 2. Use alternative fuels.
- 3. Use lightweight materials for vehicle design (so less fuel is needed).
- B. Production (manufacturing and construction)
 - 1. Utilize waste heat.
 - 2. Use more efficient furnaces.
 - 3. Practice worker conservation.

Examples: Employees can limit engine and utility use. Employees can develop a "conservation attitude".

- 4. Develop more energy efficient residences and businesses.
- 5. Use alternative energy sources.

C. Communication

1. Utilize alternative energy sources.

Example: Solar

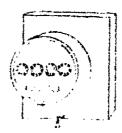

2. Develop more efficient methods.

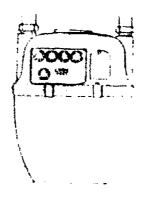

X. Reading a gas or electric meter

A. Electric meter — Measures the amount of electricity used in a unit called kilowatt-hours

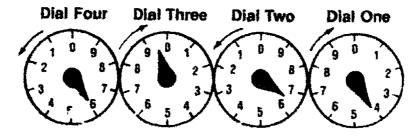

(NOTE: A kilowatt-hour (kWh) is 1000 watts of electricity flowing for one hour. Each kWh of electricity will cost a specific amount.)

- 1. Four dial meter Multiply the reading by ten
- 2. Five dial meter Read cirect; do not multiply by ten
- B. Natural gas meter Reads the same way as electric meters, except they measure in thousand cubic feet of gas. You must multiply the reading by 1000 (add three zeros to the reading).

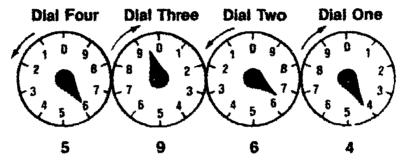

(NOTE: A gas billing may read 6.8 mcf, 1000 cubic feet, or 68 ccf, cubic feet.)

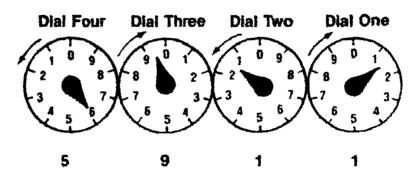

- Always read the set of dials from Right to Left.
- 2. Notice the direction of the arrows.

- 3. Read the smaller number when the pointer is between arrows.
- 4. Reread the dial to the right when the pointer is aimed directly at a number.
- 5. Write down the number indicated by the pointer if the pointer on the right has passed 0.
- 6. Write down the number next lowest to the number indicated on the first dial if the dial pointer on the right has not passed 0.

7. Calculate energy use. Subtract this reading from the previous month's reading as shown below.

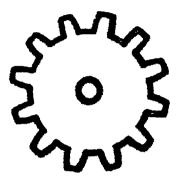

5964 This month's reading
-5911 Last month's reading

53

would be 5.3 mcf or 53 ccf of gas or 530 kwh of electricity

OVERVIEW OF ENERGY AND POWER UNIT I

HANDOUT #1 — CONSERVATION OF ENERGY

Normal Number of Degree-Days Per Year

This map is reasonably accurate for most parts of the United States but is necessarily highly generalized, and consequently not too accurate in mountainous regions, particularly in the Rockies.

RECOMMENDED INSULATION R VALUES

DEGREE DAYS	CEILINGS	WALLS	FLOORS	
Above 7000	38	17	19	
6001-7000	38 (30F)	17 (12F)	19 (11F)	
4501-6000	30	17 (12F)	19 (11F)	
3501-4500	30	12 (17E)	11 (19E)	
2501-3000	22 (30E)	11 (17E)	D (11E)	
1001-2500	19 (22E)	11 (12E)	0	
1000 and under	19	11	Ō	

Fossil fuel (gas & oil) = F Electric resistance heat = E Heat pumps with electric heat = H R Values apply to all unless otherwise shown.

These insulation "R" values are recommended to meet the FHA Minimum Property Standards for thermal resistance. The R value shown for walls can be met with any combination of sheathing and cavity wall insulation, or blanket insulation alone. For additional information, refer to Owens-Corning Pub. No. 5-BL-9293-A.

HANDOUT #1

ASSIGNMENT SHEET #2 — READ HOME METER

NAME	SCORE
Directions: below.	Read your home meter for seven days and record those readings in the blanks
1.	Make the reading at the same time each day.
2.	Draw the positions of the hands of the meter on the dials below.
3.	Write the number in the space below each dial.
4.	If your meter does not have dials, just put the number under each drawing.
5.	If your meter has only four dials, do not use the last one.
DAY 1	
	$\begin{pmatrix} 9 & 0 & 1 \\ 8 & & & 2 \\ 7 & & & 3 \\ 6 & 5 & 4 \end{pmatrix} \begin{pmatrix} 1 & 0 & 9 \\ 2 & & & 8 \\ 3 & & & 7 \\ 4 & 5 & 6 \end{pmatrix} \begin{pmatrix} 9 & 0 & 1 \\ 8 & & & 2 \\ 7 & & & 3 \\ 6 & 5 & 4 \end{pmatrix} \begin{pmatrix} 1 & 0 & 9 \\ 2 & & & 8 \\ 3 & & & 7 \\ 4 & 5 & 6 \end{pmatrix} \begin{pmatrix} 9 & 0 & 1 \\ 8 & & & 2 \\ 7 & & & & 3 \\ 4 & 5 & 6 \end{pmatrix}$

JOB SHEET #1 - PERFORM AN ENERGY AUDIT

A.	Tools	s and n	naterials
	1.	Ther	mometer (which will read 180°F)
	2.	lmme	ersion thermometer
	3.	1/2" d	lowel rod
	4.	6" ×	6" light tissue or plastic wrap
	5.	Mask	sing tape
B.	Proce	edure	
	1.	Attac	th 6" × 6" paper to dowel rod with masking tape to make draft indicator.
	2.	Take	notes on forms as you proceed using your inspection form.
	3.	Perfo	rm outside inspection on doors.
		a.	Does house have storm doors?
		b.	Do doors have weatherstripping?
		c.	Are doors properly caulked?
		d.	How many layers of glass are there in the doors?
			single pane
			☐ double pane
			☐ triple pane
	4.	Perfo	rm outside inspection on windows.
		a.	Do windows close tightiy?
		b.	Are window frames properly caulked?
		C.	Are there any broken windows?

	d.	How many layers of glass are there in the windows?
		single pane
		double pane
		triple pane
	е.	Are storm windows used during cold winter months?
	f.	What kind of frames do the windows have? (wood, metal, some of each)
5.	Insp	ect home exterior.
	a.	Is re-caulking needed?
	b.	Are other repairs needed to prevent heat loss?
	C.	Are plumbing entries tightly sealed?
	d.	Are crawl-space entries sealed?
	e.	Are mail-slots closing tightly?
	f.	Are dryer outlets sealed?
	g.	Are air-conditioning outlets sealed?
	h.	Are other exhaust outlets sealed?
6.	Perfo	orm inside inspection for airleaks.
	a.	Shut off forced-air furnace (if used in your home) and using draft indicator check doors. Are there air leaks?
	b.	Are there leaks around windows?
	c.	Are there leaks around corners to exterior walls?
	d.	Are there leaks around floor and floor boards?
	e.	Are there leaks around plumbing entries under sinks along exterior walls?
	f.	Are there leaks around electrical outlets on exterior walls?
	g.	Turn heat back on if you turned it off in Step 6a.

- 3. b, c, e, h, i, l, m, n, o
- 4. Answers should include the following information:
 - a. Fire Used for heating, cooking, and tool making
 - b. Wind Used for sailing and windmills
 - c. Water Used in water wheels and turbines to grind grain and irrigate crops
 - d. Sun Used for light and heat
- 5. Answer should include two for each of the following:
 - a. Residential and commercial areas
 - 1) Lighting
 - 2) Heating and cooling
 - 3) Cooking
 - 4) Operating appliances and equipment
 - b. Industrial areas
 - 1) Mining
 - 2) Processing
 - 3) Manufacturing materials into products
 - 4) Generating electricity
- 6. a. Human
 - b. Animals
 - c. Simple machines
- 7. a. Wedge
 - b. Inclined plane
 - c. Wheel and axle
 - d. Pulley
- 8. a. Internal combustion engine
 - b. Water turbine
 - c. Windmill
 - d. Waterwheel
 - e. External combustion engine

ANSWERS TO TEST

- 9. Answer should include the following:
 - a. Transportation
 - 1) Design and use more efficient engines.
 - 2) Use alternative fuels.
 - 3) Use lightweight materials for vehicle design.
 - b. Production (manufacturing and construction)
 - 1) Utilize waste heat.
 - 2) Use more efficient furnaces.
 - 3) Practice worker conservation.
 - 4) Develop more energy efficient residences and businesses.
 - 5) Use alternative energy sources.
 - c. Communication
 - 1) Utilize alternative energy sources.
 - 2) Develop more efficient methods.
- 10. a. Cubic feet
 - b. Kilowatt-hours
 - c. Right to left
- 11.-12. Evaluated to the satisfaction of the instructor
 - 13. Performance skills evaluated to the satisfaction of the instructor

PRINCIPLES OF ENERGY AND POWER UNIT II

UNIT OBJECTIVE

After completion of this unit, the student should be able to measure mechanical and electrical power, and build a steam turbine, a wind rotor, and an electric generator. Competencies will be demonstrated by completing the assignment sheets, job sheets, and unit tests with a minimum of 85 percent.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- 1. Match terms related to principles of energy and power with the correct definitions.
- 2. List the types of power systems.
- 3. Arrange in order the stages of power systems.
- 4. Distinguish between the basic measuring systems.
- 5. Complete a chart of basic units of measurement.
- 6. Use prefixes for changing metric base units.
- 7. State units for measuring energy and power.
- 8. Match terms related to measuring mechanical power with the correct definitions.
- 9. Calculate problems using the formula for work. (Assignment Sheet #1)
- 10. Calculate problems using the formula for horsepower. (Assignment Sheet #2)
- 11. Calculate problems using the formula for torque. (Assignment Sheet #3)

OBJECTIVE SHEET

- 12. Match terms related to measuring electrical power with the correct definitions.
- 13. State Ohm's law in letter formula for calculating voltage, current, and resistance.
- 14. Draw Ohm's law in triangle expression.
- 15. Solve problems using Ohm's law. (Assignment Sheet #4)
- 16. Demonstrate the ability to:
 - a. Build and test a simple, low pressure steam turbine. (Job Sheet #1)
 - b. Construct a wind rotor. (Job Sheet #2)
 - c. Build an electric generator. (Job Sheet #3)

PRINCIPLES OF ENERGY AND POWER UNIT II

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Make transparencies from the transparency masters included with this unit.
- C. Provide students with objective sheet.
- D. Discuss unit and specific objectives.
- E. Provide students with information and assignment sheets.
- F. Discuss information and assignment sheets.

(NOTE: Use the transparencies to enhance the information as needed.)

- 2. Provide students with job sheets.
- H. Discuss and demonstrate the procedures outlined in the job sheets.
- I. Integrate the following activities throughout the teaching of this unit:
 - Show films which demonstrate the principles of energy and power.
 - 2. Combine steam turbine (Job Sheet #1) by pulley to electric generator (Job Sheet #3) and measure electricity produced.
 - Vary rotor design of the blades on a steam turbine (Job Sheet #1) and measure the differences in energy produced. Determine the most efficient design.
 - 4. Have students apply Ohm's Law to Job Sheet #3.
 - 5. Practical application of horsepower and torque will be demonstrated in the next unit.
 - 6. Conduct various experir ents which demonstrate the principles of energy and power.
 - 7. Show examples of the various meters used for measuring electricity's voltage, current, and resistance.
 - 8. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.

SUGGESTED ACTIVITIES

- J. Give test.
- K. Evaluate test.
- Reteach if necessary.

REFERENCES USED IN DEVELOPING THIS UNIT

PRINCIPLES OF ENERGY AND POWER UNIT II

INFORMATION SHEET

I. Terms and definitions

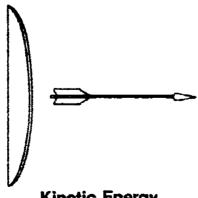

- A. Ammeter An instrument used to measure the amount of current in a circuit
- B. Ampere Unit of measure for electrical current
- C. Efficiency The percentage of available energy converted into usable energy
- D. Energy conversion The process of changing energy from one of its six forms into another

E. Friction — The resistance to motion produced when two objects rub against each other

(NOTE: Friction produces heat energy.)

F. Kinetic energy — Energy in motion

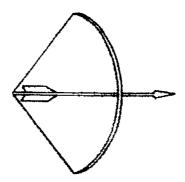

Kinetic Energy

- G. Law of conservation of energy The amount of energy in the universe is fixed; it cannot be created or destroyed
- H. Multimeter A meter that can measure different values such as voltage, current, and resistance
- Ohm Standard unit of measuring resistance to current flow
- J. Ohmmeter An instrument used to measure resistance to current flow
- K. Potential energy Stored or available energy

(NOTE: When used, potential energy becomes kinetic energy.)

The state of the s

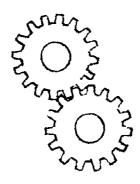

Potential Energy

L. Voltmeter — An instrument used to measure the amount of voltage in a circuit

II. Types of power systems

A. Mechanical power — Utilizes simple and complex machines to control and transmit motion.

B. Electrical power — Utilizes and controls the motion of electrons through conductive materials to transmit electricity.

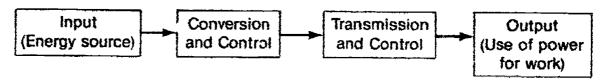

C. Fluid power — Utilizes gases or liquids to control and transmit motion.

III. Stages of the basic power theory (Transparency 1)

- A. Input
- B. Conversion and control
- C. Transmission and control
- D. Output

IV. Basic measuring systems

- A. English Measuring system traditionally used in the United States; basic units are the foot, the pound, and degree Fahrenheit
- B. Metric Measuring system used by most of the industrial countries of the world; basic units are the meter, the liter, and degree Celsius

(NOTE: This system is formally called the International System of Unit, abbreviated as SI.)

V. Basic units of measurement — Metric and English

	Measurement	Metric Units	English Units
A.	Length	millimeters centimeters meters kilometers	inches feet yards miles
В.	Weight	grams kilograms metric tons	ounces pounds tons
C.	Volume	milliliters liters cubic centimeters	ounces cups pints quarts gallons
D.	Area	square centimeters square meters	square inches square feet square yards
E.	Temperature	degrees Celsius	degrees Fahrenheit
F.	Speed	kilometers per hour	miles per hour
G.	Force	newtons	pounds
Н.	Torcus	newton-meters	pound-feet
1.	Pressure	pascals	pounds per sq. inch (psi) inches of mercury

Prefixes for changing metric base units

Prefix	+	Base Unit	=	Metric term	Value
milli- (m)	+	meter (m) liter (l) gram (g)	=	millimeter (mm) milliliter (ml) milligram (mg)	1/1000th of base unit
centi- (c)	+	meter liter gram	=	centimeter (cm) centiliter (cl) centigram (cg)	1/100th of base unit
kilo- (k)	+	meter liter gram	#	kilometer (km) kiloliter (ki) kilogram (kg)	1000 base units

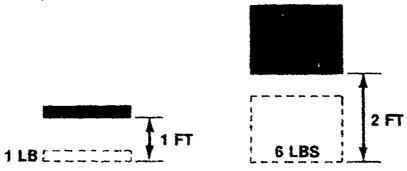

VII. Units for measuring energy and power

A.	Energy	Metric Units	English Units
	1. Mechanical	joules	foot-pounds
	2. Heat	joules, cal	British thermal units
	3. Electrical	joules	joules
B.	Power		
	1. Mechanicai	watts	horsepower
	2. Heat	watts	BTUs per second
	3. Electrical	watts	watts

VIII. Terms and definitions related to measuring mechanical power

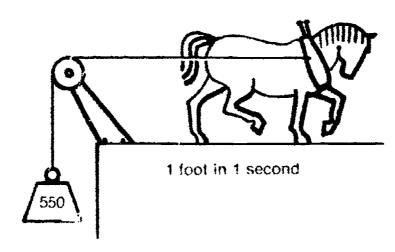

A. Work — Measurement of useful motion (mechanical energy); measured in foot-pounds.

Raising one pound a distance of one foot equals one foot-pound of work

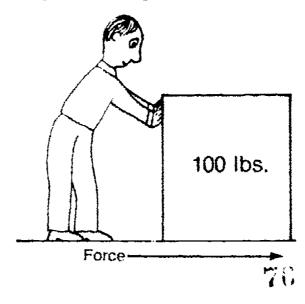

Raising six pounds two feet equals twelve foot-pounds of work

B. Power — Work per unit of time; measured in horsepower.

C. Force (F) — Any push or pull on an object; measured in pounds and newtons.

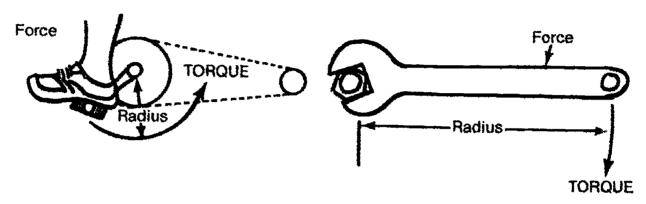

(NOTE: The term "force" should be used in all calculations of work except for those involving simple lifting when the term weight is used.)

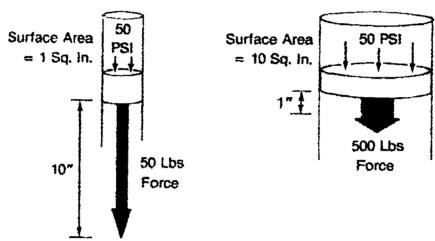

D. Torque — Turning or twisting effort; measured in pound-feet (lb-ft) or new-ton-meters.

(NOTE: We use torque whenever we turn a wheel, tighten a bolt, or pedal a bicycle.)

E. Pressure — Force per unit of area; measured in pascals or in pounds per square inch (psi) or inches of mercury (for atmospheric pressure).

IX. Formula for measuring work (Assignment Sheet #1)

Work = Force x Distance

Example: How much work is accomplished if it takes 80 pounds of force to move a 300 pound box 50 ft?

$$W = F \times D$$

$$W = 80 \times 50$$

W = 4000 ft.-lbs.

X. Formula for measuring horsepower (Assignment Sheet #2)

Horsepower =
$$\frac{\text{Force (or weight)} \times \text{Distance}}{\text{Time (sec)} \times 550}$$
 or $\frac{\text{Force (or weight)} \times \text{Distance}}{\text{Time (min)} \times 33,000}$

Example: A 180 pound man climbs a 10 foot flight of stairs in 5 seconds. How much horsepower does he develop?

$$HP = \frac{W \times D}{\text{Time (sec)} \times 550}$$

$$HP = \frac{180 \times 10}{5 \times 550}$$

$$HP = \frac{1800}{2750}$$

HP = .65 horsepower

XI. Formula for measuring torque (Assignment Sheet #3)

Torque = Force \times Radius

Example: If 25 pounds of force is applied to a wrench 2 feet long, what is the torque?

$$T = F \times R$$

$$T = 25 \times 2$$

T = 50 lb.-ft.

XII. Terms and definitions related to measuring electrical power (Transparency 2)

(NOTE: Electricity can be measured by finding the number of electrons moved from one place to another. Electrons are small and an enormous number is needed to generate a small amount of electricity. The basic unit of measurement for electricity is the coulomb. One coulomb is equal to 6,280,000,000,000,000,000 [or 6.28×10^{18}] electrons.)

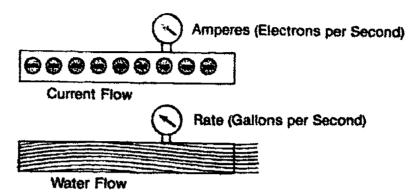

A. Amperage

- 1. The rate at which current flows through a conductor
- 2. One "amp" is equal to one coulomb of electricity passing a given point in one second.

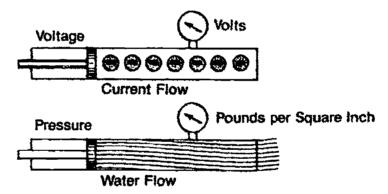

3. in calculations, the sign for amperage is I.

Example. Compare amperage to the rate at which water flows through a water line.

B. Voltage

- 1. The pressure pushing the current through the conductor
- 2. One "volt" is the pressure that moves one coulomb of electricity through a resistance of one ohm in one second.
- 3. In calculations, the sign for voltage is E.

C. Resistance

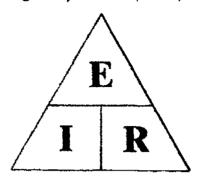

- 1. The opposition to current flow through a conductor
- 2. Measured in "ohms"
- 3. In calculations, the sign for resistance is R.

XIII. Ohm's Law in letter formula (Transparency 3 and Assignment Sheet #4)

- A. For calculating voltage: $E = 1 \times R$ or Volts = Amps \times Ohms
- B. For calculating amperage: I = E/R or Amps = Volts + Ohms
- C. For calculating resistance: R = E/I or Ohms = Volts + Amps

XIV. Ohm's Law in triangle expression (Transparency 4)

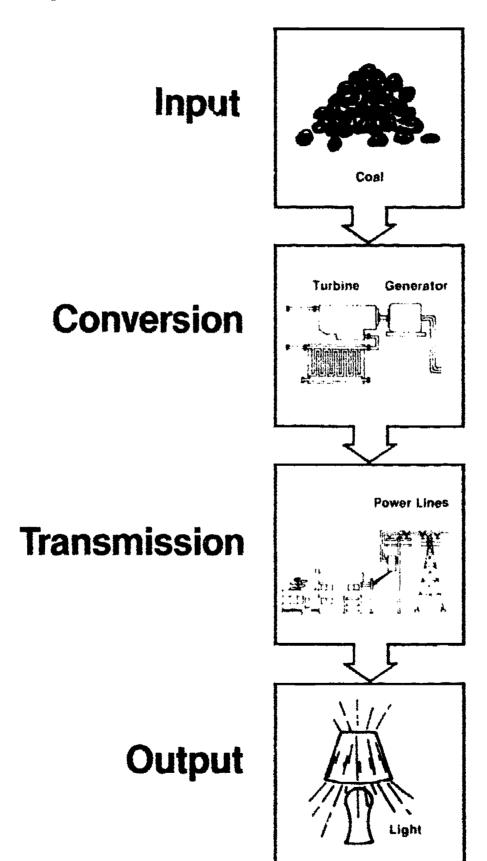

(NOTE: A reminder for the E.I.R. formula is the phrase "Even I Remember.")

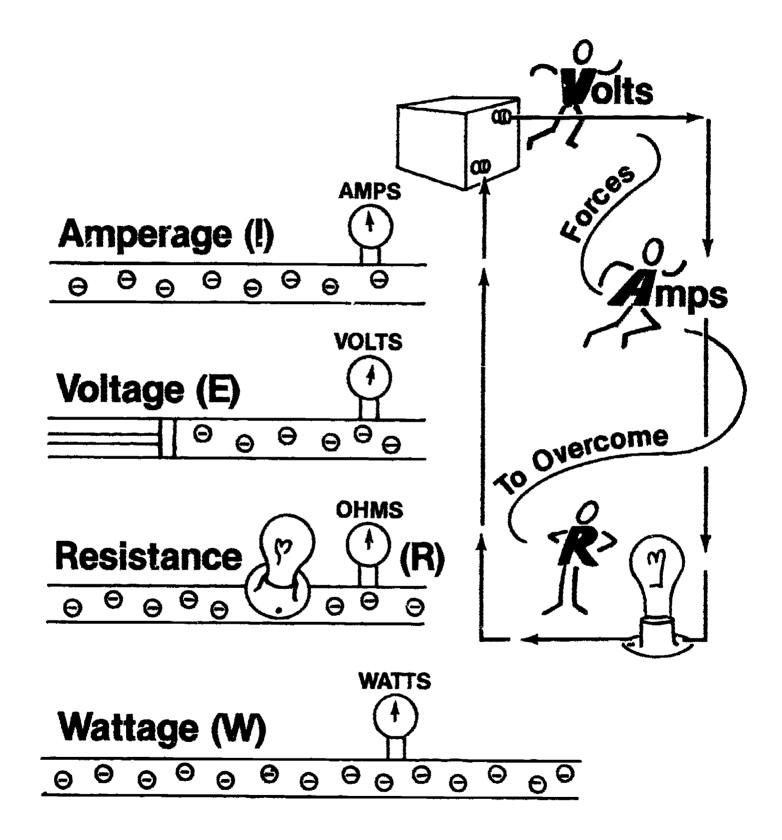

Stages of Power Theory

(Example of Electrical Power Shown)

Measurement of Electricity

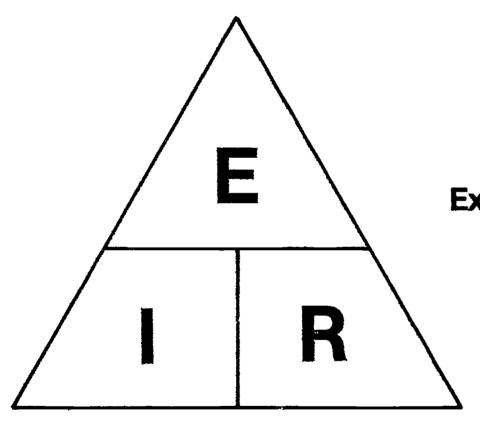

Ohm's Law in Letter Formula

Electromotive Force = Current
$$\times$$
 Resistance
Volts = Amperes \times Ohms
 $E = I \times R$

$$I = \frac{E}{R}$$

TM 3

Ohm's Law in Triangle Expression

NOTE:

Solve for Volts, Amps,

or Resistance by

Covering the Unknown

Example:

Cover E, then $E = I \times R$ Cover I, then $I = E \div R$

Cover R, then $R = E \div I$

E = Volts
I = Amps R = Resistance

ASSIGNMENT SHEET #1 — CALCULATE WORK

NAME	SCORE
Directions	s: Calculate the following problems using the formula for work:
Work = F	orce × Distance
1.	One man pushes a 200 pound weight a distance of 60 feet along a warehouse floor. The force necessary to slide the weight is 100 pounds. How much work is accomplished?
	Answer:
	How much work is accomplished if it takes 75 pounds of force to move a 350 pound object 50 feet?
	Answer:
3.	It takes 78 pounds of force to move a 230 pound box 40 feet across the rioor. How much work is accomplished?
	Answer:

ASSIGNMENT SHEET #2 — CALCULATE HORSEPOWER

NAME	SCORE
Directions:	Calculate the following problems using the formula for horsepower:
ыр	_ FxD or FxD
1117	$= \frac{F \times D}{\text{Time (sec)} \times 550} \text{ or } \frac{F \times D}{\text{Time (min)} \times 33,000}$
1.	A 100 pound woman climbs a 40 foot flight of stairs in 20 seconds. How much horsepower does she develop performing the task?
	Answer:
2.	A 1000 pound weight is moved a distance of 50 feet across the floor. The force necessary to move the weight is 190 pounds and the time required is one minute. How much horsepower is required to perform this task?
	Answer:
	A 500 pound weight is moved a distance of 10 feet along a loading dock. The force required to move the weight is 500 pounds. The task is completed in 5 seconds. How much horsepower is produced?
	Answer:
(NOTE: Prac	ctical application for calculating horsepower can be applied in Job Sheet #1. Unit

ìII.)

ASSIGNMENT SHEET #3 — CALCULATE TORQUE

NAME	SCORE
Directions	s: Calculate the following problems using the formula for torque:
Torque =	Force x Radius
1.	If a mechanic uses a wrench 10 inches long and applies a 20 pound force to the wrench handle, what is the torque on the bolt?
	Answer:
2.	If 15 pounds of force is applied to a wrench 8 inches long, how much is the torque? Answer:
3.	What is the torque if a force of 10 pounds is applied to a wrench 1 foot long?
	Answer:
MATE: D	motion application of calculation to serve as the special in the Object 84 (14.9) (11)

(NOTE: Practical application of calculating torque can be applied in Job Sheet #1, Unit III.)

ASSIGNMENT SHEET #4 — SOLVE PROBLEMS USING OHM'S LAW

NAME	
Directions unknown	: Read the problems and use the triangle expression of Ohm's law to solve for the value in each problem.
Example:	Cover the unknown in the triangle and solve. Show your work on each problem.
(NOTE: E	= Voltage; I = Amperes; R = Resistance)
1.	A current of 5 amperes is needed to operate a certain light bulb having a resistance of 4 ohms. What voltage is required?
	Answer:
2.	if it takes 10 volts to produce a current of 10 amperes, how many ohms of resistance are present? Answer:
3.	An electric horn requires 12 voits. The resistance is 20 ohms. What current does the horn take? Answer:

(NOTE: Practical application of using Ohm's Law can be applied in Job Sheet #3 of this unit.)

ASSIGNMENT SHEET #4

(NOTE: The electrical energy consumed in any resistance appears as heat. There is a definite relation between the power consumed and the heat produced. This is in accordance with the principle that energy cannot be destroyed.)

4.	A light bulb having a resistance of 5 ohms uses 2 amperes of current while in ope ation. What is the voltage applied to the circuit?			
	Answer:			
e				
5.	A horn connected to a 12 volt battery uses 3 amperes of current for its operation. What is the resistance of the horn?			
	Answer:			

ANSWERS TO ASSIGNMENT SHEETS

Assignment Sheet #1

- 1. 6000 foot pounds
- 2. 3750 foot pounds
- 3. 3120 foot pounds

Assignment Sheet #2

- 1. .3636 or approx. 4/10 horsepower
- 2. .2878 or approximately 346 horsepower
- 3. 1.818 or 1.82 horsepower or 1 th/to hp

Assignment Sheet #3

- 1. 200 pound-inches
- 2. 120 pound-inches
- 3. 10 pound-feet (120 pound-inches)

Assignment Sheet #4

- 1. 20 volts
- 2. 1 ohm
- 3. .3 amperes,
- 4. 10 volts
- 5. 4 ohms.

JOB SHEET #1 — BUILD AND TEST A SIMPLE, LOW PRESSURE STEAM TURBINE

A. Tools and materials

- 1. Tools
 - a. Propane torch
 - b. Tinner snips
 - c. Soldering Iron
 - d. Hand drill and bits

2. Materials

a. Metal can with "pop lid"

Example: Cocoa can

- b. Steel or brass tubing (1/4" diameter)
- c. Metal disc, 8 cm in diameter

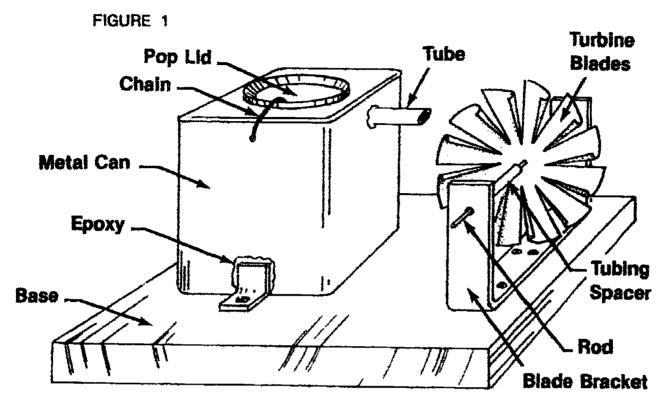

Example: The end of a food can

- d. Metal strip, 30 cm in length, 2 cm wide
- e. Stiff wire, 15 cm in length
- f. Wood or metal block (2 cm × 20 cm × 20 cm)
- g. Miscellaneous hardware

Example: screws

- h. Expoxy cement
- i. Solder, acid core

B. Procedure

- 1. Study carefully the drawing of boiler and turbine. (Figure 1)
- 2. Check the lid on the boiler can to be sure it's not pressed on too tightly.

(NOTE: The lid will act as a safety valve and pop open if the pressure in the boiler gets too high. A chain may be attached to keep the lid from flying when steam pressure builds.)

- 3. Scrape the can around the area where the hole will be made and tube inserted.
 - (NOTE: This removes any coating that would prevent solder from sticking.)
- 4. Drill hole in can the size of the tubing.
- 5. Insert tube.
- 6. Solder tube to can.
- 7. Check nozzle for blockage.
 - a. Fill boiler about one-third full of water.
 - b. Heat gradually the side of the can using the fiame from a propane torch until steam comes out. A bunsen burner or other source of heat is an option if the base is metal.

(NOTE: Steam can cause severe burns. DO NOT stand directly over can while heating. If the lid should pop off, steam and hot water may splash out.)

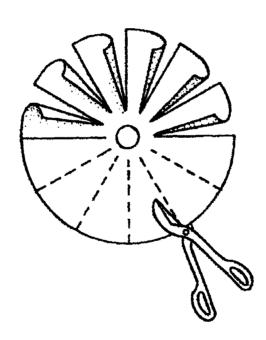

- 8. Set boiler aside to cool if all works properly. If not:
 - a. Empty water.
 - b. Cool with cold water.
 - c. Clear tube.
 - d. Check solder to assure weld is not broken.
 - e. Repeat step 7.

(NOTE: Stop at this point if this job sheet is to be combined with Job Sheets #2 and 3, and continue with Job Sheet #2.)

- 9. Drill hole in center of metal disc just large enough for rod to pass through.
- 10. Cut turbine blades from metal disc using tinner snips.

FIGURE 2

- 11. Bend blades with needlenose pliers into "scoops."(CAUTION: The cut edges of tin are very sharp, so handle carefully!)
- 12. Insert rod through turbine blades.
- 13. Solder rod to blade at center point.
- 14. Bend metal strip for blade bracket.
- 15. Drill holes in both ends of bracket so that rod holding turbine blades can turn freely.

16. Slide a short piece of tubing on either side of the shaft to keep turbine blade in line with steam nozzle.

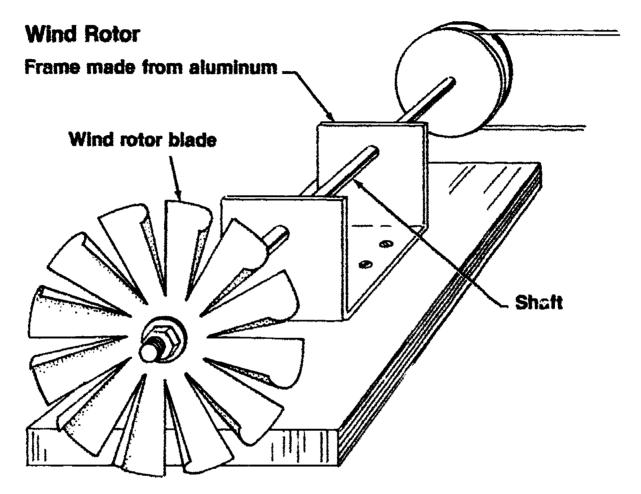

(NOTE: This should be a loose fit to allow free turning.)

- 17. Mount boiler can and blade bracket to base using wood screws if base is wood or epoxy if base is metal. Boiler nozzle must be positioned so the steam produced is directed into the turbine blades. (Figure 1)
- 18. Test turbine.

JOB SHEET #2 - CONSTRUCT A WIND ROTOR

FIGURE 1

A. Tools and materials

- 1. Tools
 - a. Tinner snips
 - b. Soldering Iron
 - c. Hand drill and bits
 - d. Needlenose pilers
- 2. Materials
 - a. Wood base (2 cm \times 20 cm \times 20 cm)

- b. Metal disc for rotor (the end of a food can, 8 cm)
- c. Metal rod for shaft, 5 mm diameter (all threaded rod)
- d. Miscellaneous hardware (screws, lock-nuts)
- e. Acid core solder
- f. Soldering flux
- g. Rivets
- h. Metal strip for bracket
- i. Pulley

B. Procedure

- 1. Choose design and mark blades. (Figure 2)
- 2. Cut rotor blades with tinner snips.

(CAUTION: The cut edges of tin are very sharp. Work CAREFULLY!)

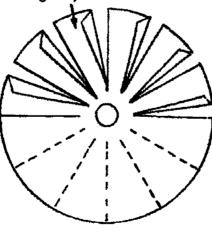

FIGURE 2

Rotor Blade Designs

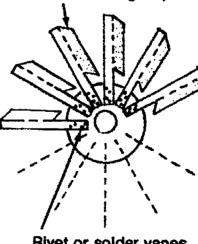

Cut metal with tin snips

and bend into vanes

Rivet or solder vanes to center disc

3. Bend blades with needlenose pliers or attach separate blades with rivets or solder (depending on design).

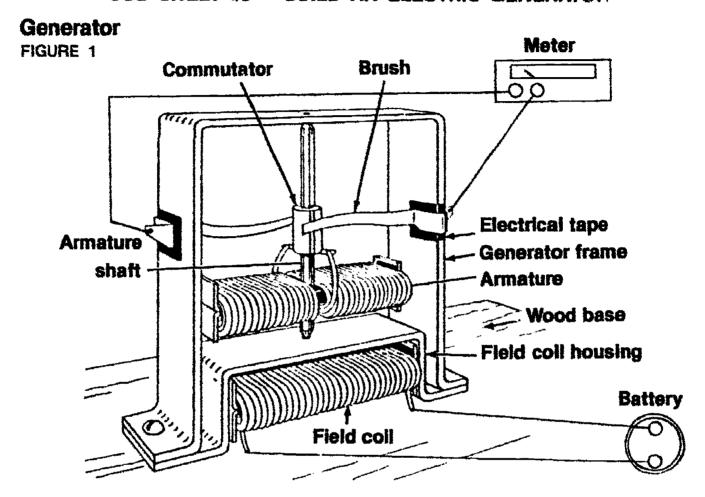

- 4. Drill hole in middle of rotor (5 mm diameter).
- 5. Mount rotor on shaft.
- 6. Place lock nut on either side of rotor to hold it to the shaft.
- 7. Bend metal strip for bracket.
- 8. Drill holes for shaft and mounting.
- 9. Mount rotor and shaft on bracket.
- 10. Mount bracket on base.
- 11. Mount pulley on shaft.
- 12. Test wind rotor outside or with a fan for a constant air supply.(NOTE: Compressed air can be used if necessary.)
- 13. Vary blade designs to improve efficiency.
- 14. Check efficiency by measuring changes in rotor speed.
- 15. Hook up pulley to electric generator (Job Sheet #3).
- 16. Are you generating electricity?

(NOTE: When the wind rotor is combined with the electric generator, additional experiments can be performed to measure voltage and amperage.)

JOB SHEET #3 — BUILD AN ELECTRIC GENERATOR

A. Tools and materials

- 1. Tools
 - a. Soldering iron (may use metal base epoxy)
 - b. Hand drill and bits
 - c. Sheet metal tools (shear and barfold) if available
 - d. Tinner snips
- 2. Materials
 - a. Aluminum sheet (14 to 18 gauge)
 - b. 16d nail
 - c. #24 coated magnet wire

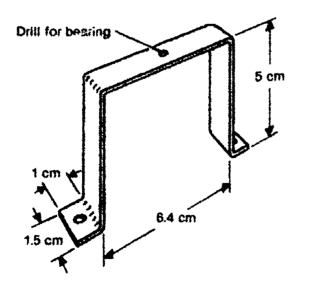

- d. Copper foil
- e. Copper or brass strip (6mm wide)
- f. Solder rosin core
- g. Electrician's tape
- h. Wood base (2 cm \times 10 cm \times 10 cm)
- i. Round head wood screws
- j. Battery
- k. Household cement/epoxy
- I. Galvanized sheet steel (24 to 28 gauge)

B. Procedure

- 1. Cut and shape metal parts as shown in the illustrations. (Figures 2-5)
 - a. Bend generator frame and drill for bearing. (Figure 2)
 (NOTE: Hole for bearing should be smaller than diameter of shaft.)

FIGURE 2

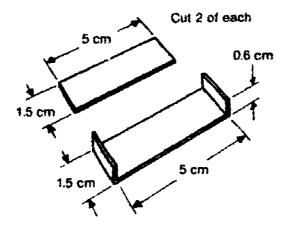

GENERATOR FRAME

14 to 18 gauge aluminum

b. Cut and bend field coil core. (Figure 3)

FIGURE 3

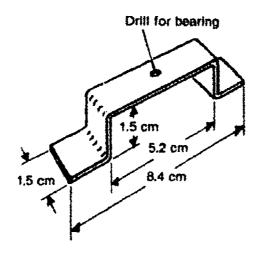

FIELD COIL CORE

24 to 28 gauge galvanized sheet iron

c. Bend field coil housing and drill for bearing. (Figure 4)

FIGURE 4

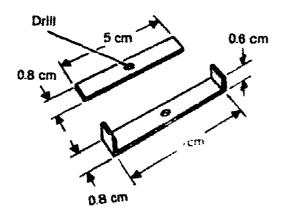

FIELD COIL HOUSING

14 to 18 gauge aluminum

d. Cut, bend, and drill armature. (Figure 5)

FIGURE 5

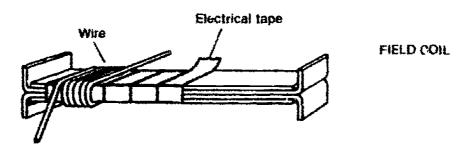

ARMATURE 24 to 28 gauge galvanized sheet iron

Cut 2 of each

2. Assemble field coil. (Figure 6)

FIGURE 6

- a. Remove sharp edges from all metal pieces.
- b. Assemble metal pieces and wrap with electric tape.
- c. Wrap five layers of enamel-coated wire over electric tape winding slowly, carefully, and in the same direction.
- d. Test completed field coil by attaching a dry cell to the two ends of the wire coil and checking with a compass. Does the compass needle line up with the length of the coil? If so, proceed.

3. Assemble armature.

- a. Remove sharp edges from metal pieces.
- b. Assemble pieces and wrap with electric tape.
- c. Place shaft in center of assembly.
- d. Wrap armature beginning at the center, leaving several centimeters of wire for later use.
- e. Wind carefully from the shaft to the end and back again to the center.
- f. Repeat, placing four layers of wire on the one side of the shaft.
- g. Cross over to the other side of the shaft without breaking the wire, and wind, going from center to end.
- h. Repeat, adding four layers of wire.
- i. Leave 2 cm of wire at the end for later use.
- j. Test armature.

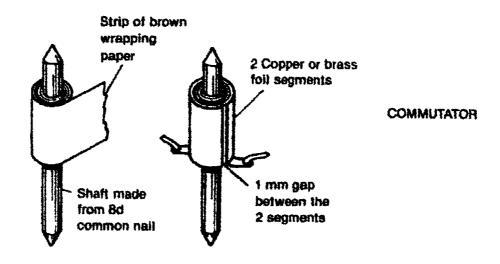

162

(NOTE: Step 2d.)

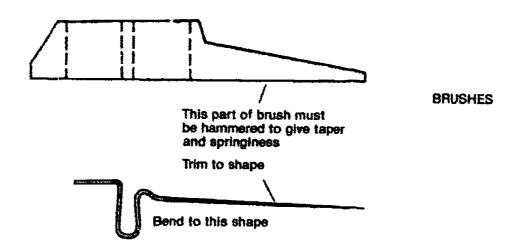

4. Make commutator. (Figure 7)

FIGURE 7

- a. Wrap brown craft paper (1 cm wide) around the shaft until a cylinder about
 7 mm in diameter is formed. Coat with household cement while wrapping.
 - (NOTE: This prevents paper from slipping and provides a firm surface for the brushes to run on.)
- b. When the glue dries, add commutator segments made from copper foil shaped around a pencil.
- c. Leave tabs where wires from the coil can be soldered.
- 5. Make brushes. (Figure 8)

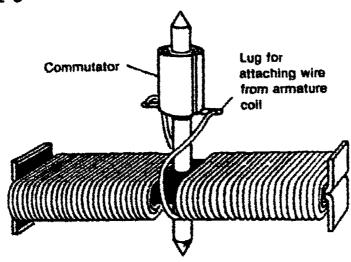

FIGURE 8

- a. Cut 2 brushes from 22 or 24 gauge copper or brass according to pattern.
- b. Hammer the tip of the brush to give taper and springiness.
- c. Trim brushes to shape.
- d. Bend brushes to shape.
- 6. Assemble annature assembly. (Figure 9)

FIGURE 9

- a. Place the shaft of the commutator in the center of the armature.
- Shaft must fit snugly. If it is necessary, solder or epoxy shaft to armature to prevent slippage.
- c. Remove enamel coating from ends of wires.
- d. Solder wires to commutative tabs.
- 7. Attach field coil to field coil housing. (See Figure 1)
- 8. Attach armature and generator frame to field coil housing.
- 9. Fasten total assembly to base. Spin the armature. If binding occurs, free pressure by bending frame so the top is moved off the shaft.
- 10. Clip brushes onto frame, placing electrical tape underneath for insulation, so that brushes rub lightly on commutator segments.
- 11. Connect field coil wires to dry cell.
- 12. Connect leads of an ammeter to brushes.

- 13. Is there any generation of electricity?
- 14. Spin the armature.
- 15. Why does electricity flow only when armature spins?

(NOTE: Additional experiments can be performed by attaching a pulley above the commutator on the generator and, using a rubber band as a belt, attach to pulloy on the wind turbine or steam turbine to produce electricity. Compressed air car be used instead of steam as a source of power. Measure the voltage and amperage produced by the generator.)

Instructions: When you are ready to perform this task, ask you indure and complete this form. All items listed under "Process Eva for you to receive an overall performance evaluation.	structor to observe t lluation" must receiv	the proce ve a "Yes"
PROCESS EVALUATION		
(EVALUATOR NOTE: Place a check man in the "Yes" or "No" ble not the student has satisfactorily achieved each step in this unable to achieve this competency, have the student review the	procedure. If the s	tudent is
The student:	YES	NO
 Checked out proper tools and materials. Cut and shaped metal parts. Assembled field coil. Wrapped wire around core. Tested completed field core. Assembled armature. Wound armature. Made commutator. Made brushes. Assembled armature assembly. Assembled field core, field core housing, generator frair armature. Connected prushes to ammeter. Connected prushes to ammeter. Connected field core to dry cell. Tested generator. Checked in/put away tools and materials. Cleaned the work area. Used proper tools correctly. Performed steps in a timely manner (hrsmin Practicer' safety rules throughout procedure. Provided satisfactory responses to questions asked. 		

PRACTICAL TEST

PRODUCT EVALUATION

(EVALUATOR NOTE: Rate the student on the following criteria by circling the appropriate numbers. Each Item must be rated at least a "3" for mastery to be demonstrated. (See performance evaluation key below.) If the student is unable to demonstrate mastery, student materials should be reviewed and another product must be submitted for evaluation.)

Criteria:

	4	3	2	1
Metal Parts	Meet Specifications	Minor Adjustment	Major Adjustment	Replace Part
	4	3	2	1
Field Coil	Operable	Minor Adjustment	Major Adjustment	Non-operable/ Redo
	4	3	2	1
Armature	Operable	Minor Adjustment	Major Adjustment	Non-operable/ Redo
	4	3	2	1
Motor	Operable	Minor Adjustment	Major Adjustment	Non-operable Redo

EVALUATOR'S COMMENTS:	······································	·

PERFORMANCE EVALUATION KEY

- 4 Skilled Can perform job with no additional training.
- 3 Moderately skilled Has performed job during training program; limited
 additional training may be required.
- 2 Limited skill Has performed job during training program; additional training is required to develop skill.
- 1 Unskilled Is familiar with process, but is unable to perform job.

(EVALUATOR NOTE: If an average score is needed to coincide with a competency profile, total the designated points in "Product Evaluation" and divide by the total number of criteria.)

- 16. Performance skills evaluated to the satisfaction of the instructor

POWER PRODUCTION AND CONVERSION UNIT III

UNIT OBJECTIVE

After completion of this unit, the student should be able to distinguish between types of internal and external combustion engines, check engine components for wear, and disassemble and reassemble a four-stroke cycle, one cylinder engine. Competencies will be demonstrated by completing the assignment sheet, job sheets, and unit tests with a minimum of 85 percent.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- Match terms related to power production and conversion with the correct definitions.
- 2. Distinguish between the types of conversions.
- 3. Select true statements concerning common direct conversion systems.
- 4. Match common methods of converting energy with the correct definitions.
- 5. Select true statements concerning the conversion of electrical power.
- 6. Distinguish between classifications of engines.
- 7. Complete statements concerning types of external combustion engines.
- 8. Match types of internal combustion engines with the correct descriptions.
- 9. Distinguish between the operations of two-stroke and four-stroke cycle gasoline engines.
- 10. Identify parts of a basic internal combustion engine.

OBJECTIVE SHEET

- *1. Match the systems of an engine with the correct functions and parts.
- 12. Complete statements concerning safety rules to follow when working with engines.
- 13. Check engine components for wear. (Assignment Sheet #1)
- 14. Demonstrate the ability to:
 - a. Disassemble and reassemble a four cycle, one cylinder engine. (Job Sheet #1)
 - b. Construct a solar battery. (Job Sheet #2)

POWER PRODUCTION AND CONVERSION UNIT III

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Make transparencies from the transparency masters included with this unit.
- C. Provide students with objective sheet.
- D. Discuss unit and specific objectives.
- E. Provide students with information εnd assignment sheets.
- F. Discuss information and assignment sheets.

(NOTE: Use the transparency to enhance the information as needed.)

- G. Provide students with job sheet.
- H. Discuss and demonstrate the procedure outlined in the job sheet.
- 1. Integrate the following activities throughout the teaching of this unit:
 - 1. Obtain manuals from manufacturers of small gas engines for a four cycle, one cylinder engine (Briggs & Stratton, etc.).
 - 2. Obtain four cycle, one cylinder engines that can be used for assembly and disassembly.

(NOTE: New engines can be obtained by writing major manufacturers on official school stationery stating reasons for request.)

- 3. Calculate torque on a small gas engine using a torque wrench.
- 4. Students can substitute scale model engines for the assembly and disassembly of small gas engines in Assignment Sheet #1 and Job Sheet #1.
- 5. Explain sub-systems of an automobile using a real automobile as a teaching aid.
- 6. Use a dynamometer to test a small engine's horsepower.
- 7. Show examples of fuel cells, solar cells, small batteries, and automobile batteries.
- 8. Have students build other solar projects such as collectors and heaters in addition to Job Sheet #2.

SUGGESTED ACTIVITIES

- 9. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.
- J. Give test.
- K. Evaluate test.
- L. Reteach if necessary.

POWER PRODUCTION AND CONVERSION UNIT III

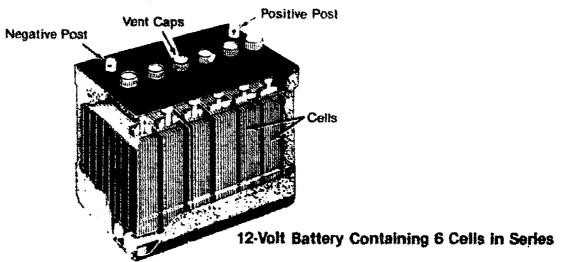

INFORMATION SHEET

I. Terms and definitions

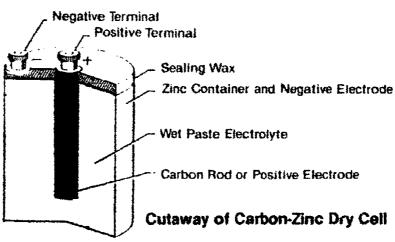

A. Alternating current (AC) — Current that alternately changes direction

B. Battery — A connected group of cells storing an electrical charge and capable of furnishing a current

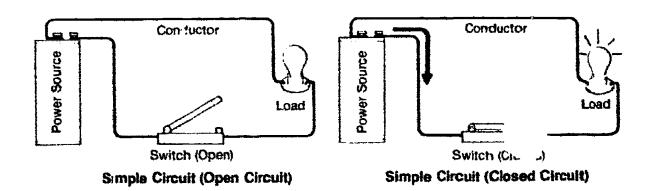

C. Cell — A container that holds electrodes and electrolytes for generating electricity by chemical action

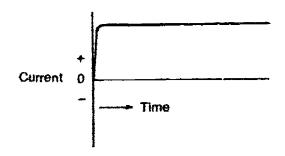

D. Circuit — The complete path of an electric current

(NOTE: A circuit must have 4 parts — A source of power, a conductor, a switch, and a load. The following illustrations show these parts in an open circuit and in a closed circuit. An open circuit is usually broken by an open switch or a disconnected wire. A closed circuit is required for current flow.)

- E. Combustion Process of burning
- F. Compression Reducing the volume of air or air-fuel mixture by pressure
- G. Conductor A substance capable of transmitting electricity easily Examples: Silver, copper, aluminum
- H. Current The movement of electrons through a conductor
- Direct current (DC) -- Current that flows through a conductor in only one direction

- J. Insulator A substance that does not allow the transmitting of electricity
 Examples: Glass, dry wood, rubber
- K. Reciprocating motion Back and forth movement
- L. Rotary motion Circular motion
- M. Stroke The movement of a piston from one end of a cylinder to the other
- N. Thrust A forward push or force

II. Types of conversions

A. Direct conversion — When energy is used after only one conversion

Examples: Solar cells convert sunlight directly into electricity, quartz or

similar crystals can convert mechanical energy into electrical

energy (known as the piezo-electrical effect)

B. Indirect conversion — When several conversions must take place before the energy is in the right form to do work

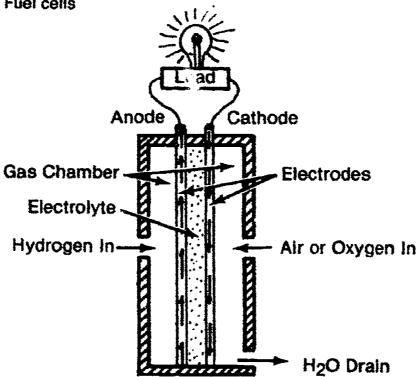

Example: Automobile engines convert fuel (chemical energy) into heat

energy for combustion then into mechanical engines to move gears and wheels; may also be converted to electrical energy

and then to light energy by headlights

III. Common direct conversion systems

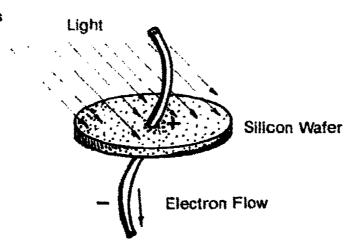

A. Fuel cells

- 1. Convert chemical energy (fuel) directly to electric energy.
- 2. Will provide a continuous flow of electric current as long as the fuel supply is continuous.
- 3. Differ from an ordinary battery in that the electrodes are **not** consumed as they are in a battery.
- 4. The most successful fuel cell is the Hydrox cell which is fueled by liquid hydrogen which mixes with liquid oxygen.

B. Sclar cells

- 1. Are crystals (selenium or silicon) that convert solar energy directly into electricity.
- 2. Are relatively expensive and are not very efficient (about 11%).
- 3. Are most useful where weight is a factor and voltage demands are low.

Example: Solar calculators, solar light meters for cameras

Common methods of converting energy (indirect conversion)

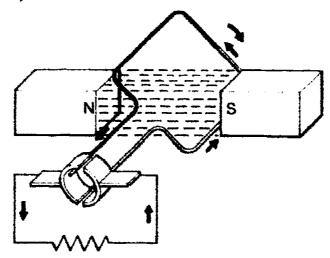

- A. Generators Convert mechanical (rotary) energy into electrical energy
- B. Engines Convert any form of energy into mechanical energy Examples: Gasoline engine, steam engine, diesel engine
- C. Turbines Rotating devices driven by wind, steam, or water that are used to drive electric generators
- D. Motors An electrical or fluid-operated device that converts energy to mechanical energy

V. Conversion of electrical power

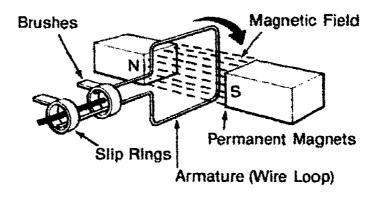

A. Generators are used to convert mechanical energy to electrical energy.

- B. There are two types of generators.
 - Direct current (DC) generators Produce electric current that flows in only one direction

2. Alternating current generators — Produce electric current that reverses the direction of current flow many times each second.

(NOTE: Alternating current is more widely used than direct current because it can be readily changed to high voltages for transmission over long distances by transformers.)

- C. Generators vary in size. Large generators are used to provide electric power for cities.
- D. Large generators are usually powered by steam turbines or hydroelectric power.

(NOTE: About 80% of the electricity used in the United States is produced by steam turbine powered generators.)

VI. Classifications of engines (Transparency 1)

A. Internal combustion engine

Examples: Gasoline engine, diesel engine, jet engine

- 1. Produces power by the intermittent (not continuous) combustion of a fuel/air mixture in a combustion chamber in the engine.
- 2. Expanding hot gases in chamber produce work by pushing a piston, turning a turbine, or producing reaction propulsion (as in a rocket engine).

B. External combustion engine

Examples: Steam engine, steam turbine, Stirling engine

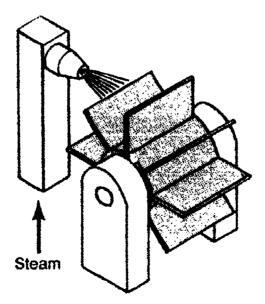

- 1. Produces power by the continuous combustion of a fuel source burned outside of the engine.
- 2. Burning fuel converts a working fluid (usually water) into a high-pressure vapor (steam) which is then delivered to the engine.

VII. Types of external combustion engines

- A Steam engines (Transparency 2)
 - Operation A fuel source is burned and heats a boiler. Heat converts water to steam. Steam travels through pipes to the engine. Steam pressure inside engine drives pistons and produces motion.
 - 2. Possible energy sources for steam engines include all fossil fuels as well as nuclear, radiant, and geothermal energy.

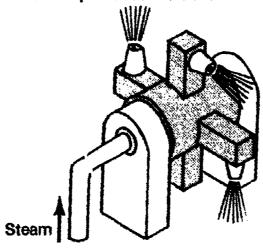

B. Steam turbines

1. Impulse type — High-pressure steam is directed against the turbine blades which causes the turbine wheel to rotate at high speeds.

 Reaction type — Steam escapes from nozzle on the turbine wheel; the action of the escaping steam creates an opposite reaction in the wheel that produces rotation.

C. Stirling engine (Transparency 2)

(NOTE: This engine was invented by Robert Stirling in 1816.)

 Operation — Heat is applied to the outside of the engine cylinder which causes the gas inside the cylinder (usually hydrogen or helium) to expand. This increases the pressure which causes the piston to move down. Then the gas in the cylinder is cooled by an outside cooler which causes the gas to contract, pressure drops, and piston moves back up.

(NOTE: Modern Stirling engines use two pistons instead of one, the compression piston and the expansion piston.)

Potential and problems — Are more fuel-efficient and powerful than
common internal combustion engines. Are hard to keep cool, and the
working gases (hydrogen and helium) are difficult to contain at their
high pressures. Leaks of the gas can be safety hazards since they
are highly flammable.

Viti. Types of internal combustion engines (Transparencies 3 and 4)

- A. Gasoline (piston) engines (Transparency 3)
 - 1. Produce reciprocating motion by drawing a fuel-air mixture into a closed chamber (cylinder), compressing the mixture, and igniting it which creates pressure to drive a piston; cycle then repeats.
 - 2. Cycle has four actions Intake, compression, combustion (power), and exhaust.

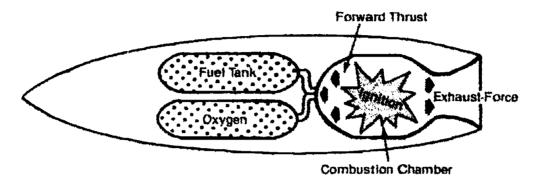

- 3. There are two basic types:
 - a. 2-stroke cycle engine Piston moves 2 strokes to complete a cycle.
 - 4-stroke cycle engine Piston moves 4 strokes to complete a cycle.
- B. Diesel engines (Transparency 3)
 - 1. Are similar to gasoline engines in that they have cylinders and pistons and burn a liquid fuel.
 - Are different from gasoline engines in that the air and fuel is mixed inside the cylinder, diesel fuel is used instead of gasoline, and there is no electrical spark to ignite the fuel. Ignition depends on the temperature and pressure of the fuel vapors.
- C. Rotary engines (Transparency 3)

(NOTE: The rotary engine is sometimes referred to as the Wankel engine named for its inventor.)

- 1. Produce circular motion through a triangular-shaped rotor which spins inside a chamber (instead of a piston in a cylinder).
 - a. The rotor has three equal faces and three working chambers.
 - b. Each is separated in timing from the other faces and each provides a power impulse during one revolution of the rotor.
- 2. Produces three power strokes for every rotor revolution.
- 3. Are smaller and quieter than gasoline and diesel engines, but have low fuel efficiency and short seal life.
- D. Jet and rocket engines Produce linear motion through jet propulsion based on Newton's Third Law of Motion (For every action there is an equal and opposite reaction). The rearward expulsion of hot gases (force) creates an opposite reaction which propels the craft forward (thrust).
 - 1. Jet engines (Transparency 4)
 - a. Draw their air for combustion from the outside atmosphere. (The efore, they cannot be used in space where there is no air.)
 - b. Common types of jet engines include turbojet, ramjet, turbof and turboprop engines.

- 2. Rocket engines (Transparency 4)
 - a. Must carry their own supplies of oxygen. (Therefore, they can operate in space.)
 - b. The two types of rocket engines are liquid propellant (fuel and oxygen) and solid propellent.

IX. Operation of two-stroke and four-stroke cycle gasoline engines (Transparency 5)

(NOTE: The number of strokes refers to the number of times the piston moves up and down in the cylinder to complete one cycle of operation. Two-stroke cycle engines are commonly called two cycle engines, and four-stroke cycle engines are commonly called four cycle engines.)

A. Two-stroke cycle engines

- 1. Compression stroke (intake and compression)
 - a. When piston is at the bottom position (BDC), fuel-air mixture enters cylinder through ports in cylinder wall.
 - b. Piston moves up cylinder and compresses fuel-air mixture.
- 2. Power stroke (combustion and exhaust)
 - a. Compressed fuel-air mixture is ignited. Pressure from expanding gases forces the piston downward.
 - b. Exhaust gases are forced out the exhaust ports of the cylinder.

B. Four-stroke cycle engines

- 1. Intake stroke
 - a. Cycle starts with piston at uppermost position in cylinder (TDC) with intake valve open and exhaust valve closed.
 - b. As the piston moves down the cylinder, it draws air-fuel mixture into the cylinder from the carburetor.
 - c. When the piston reaches the bottom of the cylinder (BDC), the intake valve closes.

2. Compression stroke

- a. Air-fuel mixture is compressed tightly as the piston moves up the cylinder.
- b. Compression of the fuel creates heat which prepares the fuel for instant ignition.

3. Power stroke

- a. As the piston reaches the top of the cylinder on compression stroke, a spark from the ignition system ignites the air-fuel mixture.
- b. Burning gases expand very rapidly and force the piston down the cylinder.

4. Exhaust stroke

- a. As the piston reaches the bottom of the cylinder on power stroke, the exhaust valve opens.
- b. Piston travels up the cylinder, forcing the burned gases out of the cylinder into the exhaust manifold.

(NOTE: The complete cycle takes two rotations of the crankshaft or 720 degrees of rotation. The crankshaft converts the reciprocating motion of the piston into rotary motion to operate the gears.)

X. Basic internal combustion engine parts (Transparency 6)

- A. Cylinder block Cylinder (middle part of engine) and crankcase (bottom part of engine)
- B. Cylinder head Top part of engine bolted to cylinder block
- C. Piston Moves up and down in cylinder
- D. Connecting rod Connects piston to crankshaft
- E. Crankshaft Provides mechanical power to run the engine
- F. Camshaft Shaft which contains lobes or cams to operate engine valves
- G. Valves Devices for alternately opening and closing a passage (such as for exhaust and intake)
- H. Valve spring Spring attached to a valve to return it to the seat
- 1. Valve lifter or tappet Push rod or plunger used to transfer motion between the cam and the valve on an engine

Xi. Systems of an engine

A. Mechanical system

- Function Develops up-and-down motion and converts it into useful rotary motion
- 2. Parts involved Cylinder block and head, piston, connecting rod, crankshaft, camshaft, valves

B. Lubrication system

- 1. Function Lubricates (oils) engine parts to reduce friction and wear
- 2. Parts involved Oil pump and values

(NOTE: For a two-stroke engine the oil is mixed with the fuel before filling the fuel tank. Additional parts are not involved.)

C. Cooling system

- 1. Function Removes excess heat from the engine
- 2. Parts involved Cylinder block and head has fins to release heat when air cooled or a water jacket and pump when water cooled

D. Fuel system

- 1. Function Mixes air and fuel properly and delivers the mixture to the combustion chamber
- 2. Parts involved Air cleaner, fuel supply tank, valve, oil filter, carburetor (mixes air and fuel for combustion), governor (evens out changes in engine speed)

E. Ignition system

- 1. Function Produces the spark that ignites the fuel
- 2. Parts involved (depending on type of system) Armature, magnets, breaker points, condenser, spark plug, battery

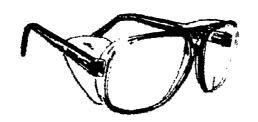

F. Starting system

- 1. Function Sets the engine in motion
- 2. Parts involved Manual or electric starters

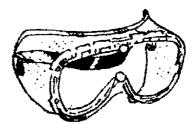

XII. Safety rules when crorking with engines (Transparency 7)

A. Wear safety glasses or goggles at all times. Remember that your eyes can't be replaced. Protect them.

Safety Glasses (with Sideshields)

Safety Goggles (Perforated Frames)

Eye Protection

B Wear approved ear protectors while working with running engines. Some are very noisy and can permanently damage your hearing.

Ear Plugs

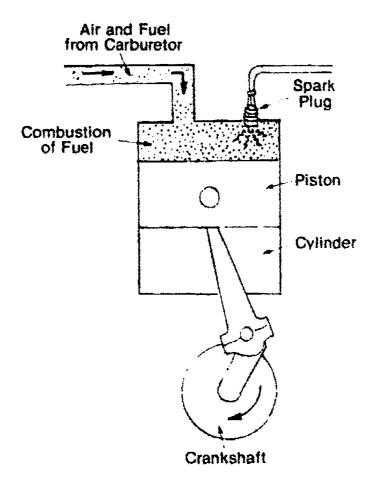

Ear Muffs

Hearing Protection

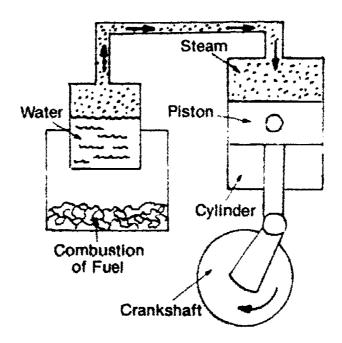

- C. Store fuel in approved safety cans in the storage areas designated by your instructor.
- D. Do not inhale fumes from fuel or solvent containers. The fumes can seriously damage your lungs.
- E. Have adequate ventilation when running engines, or where fumes may be a hazard.
- E Keep all flammable liquids avay from fire, heat sources, and sparks which could ignite the liquid.
- G. Wash your hands thoroughly if fuel splashes on them. It is very harsh and usually contains additives that are poisonous when absorbed through the skin.
- H. Never use fuel to clean parts; only use cleaning solvents.
- I. Do not pour fuel into a hot or running engine fuel tank.
- Wipe up any gasoline spills immediately.
- K. Be careful when handling an engine battery. It contains acid which can ruin your clothes, burn your skin, and blind you if it gets in your eyes.

ASSIGNMENT SHEET #1 - CHECK ENGINE COMPONENTS FOR WEAR

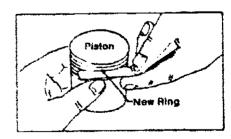

Directions: Complete this assignment after the engine is disassembled in Job Sheet #1. When examining engine, describe condition of parts and give dimensions as indicated. If parts are broken or cracked, mark location of break on drawing. Report condition of engine with check (/) mark where possible.

JOB SHEET #1 — DISASSEMBLE AND REASSEMBLE A FOUR CYCLE, ONE CYLINDER ENGINE

A. Tools and materials

- 1. Gasoline container, for drained gasoline
- 2. Oil container, for drained oil
- 3. Metal pan to hold engine
- Four cycle, one cylinder engine (Briggs and Stratton shown)
 (NOTE: Slight variations should be made in the procedure for other brands of engines.)
- 5. Parts cleaner pan
- 6. Penetrating oil
- 7. Pipe wrench
- 8. Flywheel holder
- 9. Clutch wrench
- 10. Parts cleaning brush
- 11. Feeler gauge
- 12. Wire gauge
- 13. Valve spring compressor tool
- 14. Flywheel puller
- 15. Ring compressor tool
- 16. Telescoping gauge
- 17. Torque wrench
- 18. Direct reading
- 19. Micrometer
- 20. Combination wrench set
- 21. Ring expander tool

B.

JOB SHEET #1

22.	Pist	on ring groove cleaner
23.	Plug	g gauge
24.	Reje	ect gauge
25.	Ring	g grooving tool
Proce	edure	
(NOT	E: Be	fore starting this job sheet — read safety criteria in manufacturer's manual.
1.	Plac	e engine in metal pan on workbench.
2.	Disc	connect spark plug wire from spark plug.
3.	Drai	n gasoline tank into designated container.
4.	Drai	n oil out of crankcase into designated container.
5.	Obta	ain copy of manufacturer's manual for your engine from your lab library.
6.	Follo engi	ow procedure recommended by the manufacturer in disassembling your ine.
7.	Rec	ord nameplate data:
	a.	Manufacturer
	b.	Serial No.
	c.	Model No.
	d.	Horsepower
	e.	No. of Cylinders
8.	Rem	nove air cleaner and clean parts, except filter, in the parts cleaner pan.
9.	Fill i	in the information regarding condition of air cleaner.
	AIR	CLEANER ELEMENT Dry Element

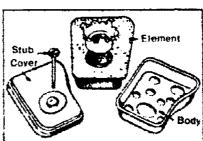

Clean _____ Dirty ____

Missing _____ Worn ____

Bent _____ Broken ____

MOUNTING GASKET:

AIR CLEANER STUD:

- 10. Wipe air cleaner parts dry following removal from cleaner pan.
- 11. Remove muffler only to replace.
 - a. Use penetrating oil, if badly rusted, on the threads.
 - b. Allow it to soak until next day.
 - c. Remove with a pipe wrench.

(NOTE: Some engines have a locking nut on the muffler pipe. Be sure to loosen locking nut first.)

- 12. Remove fuel lines, filter (if provided), and connections between the fuel tank and carburetor.
- 13. Remove carburetor linkage after making a sketch for reassembling.
- 14. Remove breather pip.

(NOTE: On some models this is located between the valve cover and carburetor.)

- 15. Remove carburetor as:ie .nbly.
- 16. DO NOT disassemble at this time.

(NOTE: On suction fuel, be very careful not to bend brass tubes on the bottom of the carburetor.)

17. Remove fuel tank.

(NOTE: Some models may have fuel tank and blower housing spot welded together. If so, remove as a unit — the tank and the blower housing.)

18. Remove blower housing.

(NOTE: This may be called flywheel guard.)

- 19. Spin flywheel with rope or by hand to check compression.
- 20. Record results of the compression check:

a.	G000
b.	Fair
c.	Poor

(NOTE: It should rebound sharply when turned quickly against compression to be considered good.)

21.	Use right		check air gap armature to	o fly wheel, both sides — left and

	a.	Left side		
	b.	Right side		
23.	Rem	ove spark plug.		
24.	Che	ck gap with wire (gauge.	
25.	Rec	ord spark plug ga	p	
26 .	Ctea	n spark plug.		
27.	Rem	ove governor blad	de (air vane) CAREFULLY	to prevent damage to blade.
28.	Rem	ove rope starter (pulley using special tool	to hold the flywheel.
29.		ect the threaded aded before loose		ermine whether it is left or right
	(NO	TE: Briggs & Stra	atton engines are usual ning clockwise.)	ly left thread. If a recoil starter,
30.	Rem	Remove valve cover plate CAREFULLY so as not to damage gasket.		
31.	Rem	ove cylinder head	t being careful not to ma	ar mating surface.
32.	Che	ck tappet clearan	ce with feeler gauge and	record.
	a.	Valve clearance	-intake -	
	b.	Valve clearance	exhaust —	
	c.	Manufacturer's	recommended clearance	9 —
33.	Rem	nove valve springs	, using valve spring com	pression tool.
	(NO	TE: Do not lose th	ne small washers in remo	oval.)
34.	Mea	sure and record t	he following on both val	ves.
	a.	Face	Intake	Exhaust
	b.	Margin		
	c.	Stem		
	d.	Guidf,		

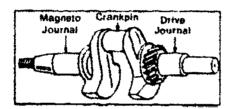

35.	Remove the fly wheel, using puller best suited for your model.
	(NOTE: Be sure to pick up the key.)

- 36. Remove breaker point cover.
- 37. Measure and record breaker point gap with feeler gauge.

Breaker point gap

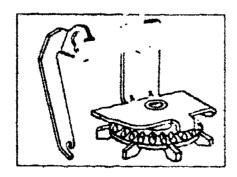

- 38. Remove breaker arm assembly and condenser taking care not to damage or lose the plunger or carn.
- 39. Remove ignition wire.
- 40. Check crankshaft and play.
- 41. Record wear on magneto journal, crankpin, and drive Journal.

Crankshaft Magneto Journal:	
Worn	Scored
*Size Crankpin:	**************************************
Worn	Scored
*Size	
Drive Journal:	
Worn	Scored
*Size P.T.O.:	
Bent	Broken

- 42. Inspect crankshaft extension for burrs.
- 43. Remove all burrs with emery cloth or by filing.
- 44. Remove crankcase cover (starter plate).
- 45. Turn upside down, with vertical shaft, so camshaft will not fall out before timing can be noted.
- 46. Remove oil pump, dipper or slinger.

Record any damage.

Oil Slinger Describe damage						

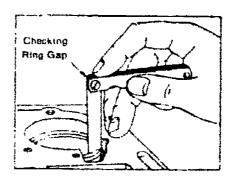

47.	Inspect timing	gears for timing n	narks.
48.	Remove came	haft gear and tapp	ets.
49.	Remove conn	ecting rod and pist	on assembly.
50.	Check connect following:	ting rod and cap fo	r mating marks before removing and record the

	¢.	Oil ring
6 3.	Clear	all parts and inspect for wear.
64.	Comp	plete Assignment Sheet #1 at this point.
65.	Repla	ce parts which are worn beyond manufacturer's recommended limits.
66.	Make	new gaskets, if required.
67.	Dress bling.	down all mating surfaces which are scratched or marred before reassem

POWER PRODUCTION AND CONVERSION UNIT III

JOB SHEET #2 - CONSTRUCT A SOLAR BATTERY

A. Tools and materials

- 1. Tools
 - a. Voltmeter (0-1 and 0-10 volt range)
 - b. Ammeter (0-1 and 0-10 ampere range)
 - c. 3/4" drill
 - d. Square

2. Materials

- a. $1 \frac{3}{4}$ " \times 8" \times 8" plywood or board
- b. 1 3/4" dowel rod, 9" long
- c. Glue
- d. 1 #49 lamp socket and bulb
- e. 6 Photovoltaic cells, 400-500 MA (milliampere capacity)
- f. 14 quick disconnect connectors
- g. 10 bell wires*, 6" long (*#18-#22 gauge multiple-strand flexible insulated wire)
- h. 6 bell wires*, 12" long
- i. 1 3/4" x 8" x 12" plywood base
- j. 1 3/4" x 3" x 3" plywood base
- k. Fasteners

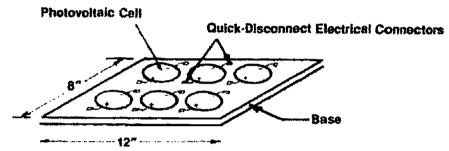

B. Procedure

- 1. Drill a 3/4" hole in the center of the 8" \times 8" plywood or board.
- 2. Brush glue in all parts of the hole.

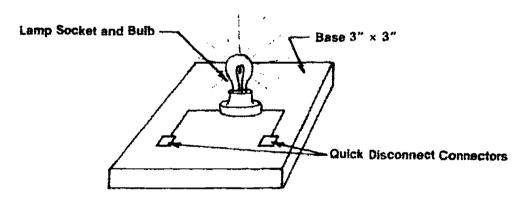

- 3. Insert dowel rod making sure it does not extend from the bottom.
- Using a square, check the angle of the dowel rod and board to ensure a 90° angle is formed in all directions — BEFORE THE GLUE SETS. This is your "sun target."
- 5. Arrange the six photovoltaic cells so that they are evenly spaced on the plywood base.

FIGURE 1

- 6. Glue the cells to the base, and number them.
- 7. Connect each cell electrical lead to a quick disconnect and fasten them to the mounting board as shown in Figure 1.
- 8. Mount the lamp socket and bulb in the center of the base using an adhesive to secure it to the base.

FIGURE 2

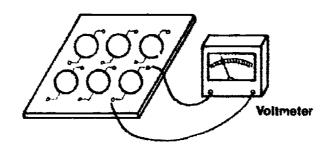

9. Connect the socket electrical leads to the quick disconnects and fasten them to the board. See Figure 2.

10. Test each cell one at a time using voltmeter.

(NOTE: When placed in the sun each cell operates as a small source of electricity. The voltage of each cell will be approximately 0.45V, and the amperage up to the rated capacity of the cell. Cell output will also depend upon the available light.)

FIGURE 3

11. Place cells in sunlight.

(NOTE: A lamp or other light source may be used if sunlight is not available.)

12. Use sun target to position cells for maximum output.

(NOTE: Point the dowel toward the sun so that NO shadow is cast by the dowel. The base is now at a right angle to the sun and is receiving maximum sunlight.)

13. Place base of target on cells and adjust until dowel casts NO shadow to ensure maximum sunlight. Remove sun target.

(NOTE: Since photovoltaic cells convert radiant energy as it is received, you can see the output vary as you move the mounting board and cells.

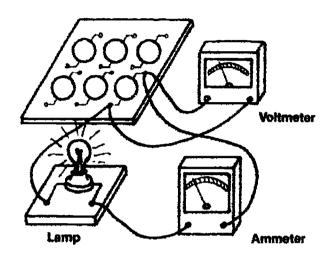

14. Read and record the voltage of each cell:

Cell 1	Cell 4
Cell 2	Cell 5
Cell 3	Cell 6

15. Connect the lamp, ammeter, and voltmeter to a single cell.

FIGURE 4

(NOTE: The ammeter is wired in series — all electricity passing through the lamp also passes through the ammeter. The voltmeter is wired in parallel — it measures electrical pressure and the circuit electricity does **not** pass through it.)

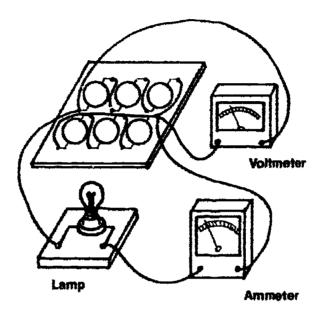

Record the voltage and amperage.
Vol'.age
Amperage
Describe the brightness of the lamp.

18. Add cells in series as shown in Figure 5.

(NOTE: Note that cells wired in series have all the electricity passing through each cell.)

FIGURE 5

(NOTE: This will provide a higher voltage at a constant amperage to the lamp.)

19. Record voltage and amperage with 2, 4, 6 cells in series.

Celis in Series	2	4	6
Voltage			
Amperage			

- 20. Is voltage increased, decreased, or does it stay the same as cells are added?
- 21. Is amperage increased, decreased, or does it stay the same as cells are added?_
- 22. Describe what happens to the brightness of the lamp.

		4) The most successful fuel cell is the Hydrox cell which is fueled uid nitrogen which mixes with liquid oxygen.	by liq-
	b.	Solar cells	
		1) Are crystals (selenium or silicon) that convert solar energy direc electricity	tly into
		2) Are relatively inexpensive and are very efficient	
		3) Are most useful where weight is a factor and voltage demands a	are low
4.	Match	common methods of converting energy on the right with the correct defin	nitions.
		Convert any form of energy into mechanical 1. Generator energy	
		2. Engines An electrical- or fluid-operated device that converts energy to mechanical energy 3. Turbines	
	A Trade to the Law of the Law of	. Convert mechanical (rotary) energy into 4. Motors electrical energy	
		Rotating devices driven by wind, steam, or water that are used to drive electric generators	
5.	Select next to	rue statements concerning the conversion of electrical power by placing the true statements.	an "X"
		Generators are used to convert mechanical energy into electrical e	nergy.
		There are two types of generators, AC and BC.	
		Generators vary in size. Small generators are used to provide e power for cities.	lectric
		Large generators are usually powered by steam turbines or hydroe power.	lectric

6.	Distinguish between the classifications of engines by placing an "E" in front of the
	characteristics of external combustion engines and an "I" in front of internal combus-
	tion engine characteristics.

- ____a. Produces power by the continuous combustion of a fuel source burned outside of the engine.
- ____b. Produces power by the intermittent (not continuous) combustion of a fuel/ air mixture in a combustion chamber in the engine.
- Expanding hot gases in chamber produce work by pushing a piston, turning a turbine, or producing reaction propulsion.
- Burning fuel converts a working fluid (usually water) into a high pressure vapor which is then delivered to the engine.
- 7. Complete the following statements concerning the types of external combustion engines by circling the correct words.
 - a. Steam engines use (fuel combustion, steam pressure) to drive pistons and produce motion.
 - b. The type of steam turbine shown below is the (impulse type, reaction type).

- c. The Stirling engine commonly uses (gasoline, steam, hydrogen) for pressure to move the piston(s).
- d. The Stirling engine is (more, less) fuel-efficient and powerful than an internal combustion engine.

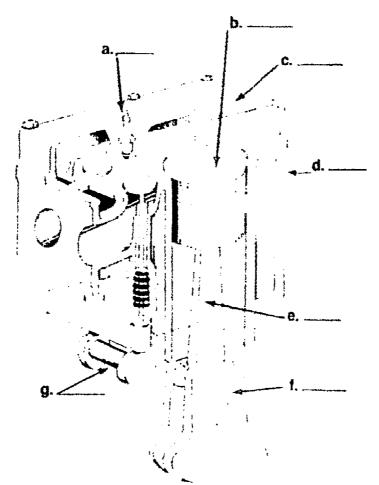

8.	Match type	s of internal combustion engines on the right wi	th the correct descriptions.
	a.	The rearward expulsion of hot gases creates an opposite reaction which propels the craft	1. Gasoline engine
		forward.	2. Diesel engine
	b.	Cycle has four actions — Intake, compression, combustion, and exhaust.	3. Rotary engine
	c.	Produces three power strokes for every rotor revolution.	4. Jet and rocket engines
	d.	The air and the fuel is mixed inside the cylinder and there is no electrical spark to ignite the fuel.	
9.	Distinguish placing a " engine ope	between the operations of a two-stroke and for 2" in front of two-stroke engine operations and rations.	our-stroke cycle engine by "4" in front of four-stroke
	a,	Power stroke	
		 As the piston reaches the top of the cylinde spark from the ignition system ignites the a Burning gases expand very rapidly and force der. 	ir-fuel mixture.
	b.	Power stroke

	C.	Compression stroke	
		 "r-fuel mixture is compressed tightly as the der. Compression of the fuel creates heat wh instant ignition. 	•
	d.	Exhaust stroke	
		 When piston is at the bottom position (BDC), inder through ports in cylinder wall. Piston moves up cylinder and compresses f 	·
	е.	Compression stroke	
		 When piston is at the bottom position (BDC), inder through ports in cylinder wall. 	fuel-air mixture enters cyl-
		2) Piston moves up cylinder and compresses f	uel·air mixture.

____f. Intake stroke

- 1) Cycle starts with piston at uppermost position in cylinder (TDC) with intake valve open and exhaust valve closed.
- 2) As the piston moves down the cylinder, it draws air-fuel mixture into the cylinder from the carburetor.
- 3) When the piston reaches the bottom of the cylinder (BDC), the intake valve closes.
- 10. Identify the parts of an internal combustion engine. Choose your answers from the list at the right.

- 1. Connecting rod
- 2. Valve spring
- 3. Cam lobo
- 4. Cam shaft
- 5. Piston
- 6. Valves
- 7. Cylinder head
- 8. Spark plug
- 9. Cylinder block
- 10. Valve lifter
- 11. Crankshaft

17.	match the s	systems of an engine on the left with the correc	t functions and parts.
	a.	Function — Mixes air and fuel properly and delivers the mixture to the combustion chamber Parts involved. Air cleans fuel sample.	 Mechanical system Lubrication system
		 Parts involved — Air cleaner, fuel supply tank, valve, oil filter, carburetor, governor 	3. Cooling system
	b.	1) Function — Removes excess heat from the engine	4. Fuel system
		2) Parts involved — Cylinder block and head when air cooled or a water jacket	5. Ignition system
		and pump when water cooled	6. Starting system
	c.	 Function — Sets the engine in motion Parts involved — Manual or electric rarters 	
	d.	Function — Oils engine parts to reduce friction and wear 2) Parts involved — Oil pump and valves	
	е.	1) Function — Produces the spark that	
		ignites the fuel 2) Parts involved (depending on type of system) — Armature, magnets, breaker points, condenser, spark plug, battery	
	f.	Function — Develops up-and-down motion and converts it into useful rotary motion	
		 Parts involved — Cylinder block and head, piston, connecting rod, crankshaft, camshaft, valves 	
12.	Complete st word in the	atements concerning safety rules by placing the blank.	number of the appropriate
	a.	Wear or goggles at all times. Remember that your eyes can't be	1. Immediately
		replaced. Protect them.	2. Engines
	b.	Wear approved	3. Fuel
		are very noisy and can permanently damage your hearing.	4. Ear
	C.	Store in approved safety	5. Safety glasses
		cans in the storage areas designated by your instructor.	6. Battery

	d.	Do not inhale fumes from or solvent containers. The fumes can seriously damage your lungs.
	e.	Have adequate ventilation when running, or where fumes may be a hazard.
	f.	Wash your hands thoroughly if splashes on them. It is very harsh and usually contains additives that are poisonous when absorbed through the skin.
	g.	Never use to clean parts; only use cleaning solvents.
	h.	Wipe up any fuel spills
	i.	Be careful when handling an engine It contains acid which can ruin your clothes, burn your skin, and blind you if it gets in your eyes.
(NOT	E: If the foliouctor when the	owing activities have not been accomplished prior to the test, ask your many should be completed.)
13.	Check engin	e components for wear. (Assignment Sheet #1)
14.	Demonstrate	the ability to:
	a. Disas	semble and reassemble a four cycle, one cylinder engine. (Job Sheet #1)

Construct a solar battery. (Job Sheet #2)

POWER TRANSMISSION AND STORAGE UNIT IV

UNIT OBJECTIVE

After completion of this unit, the student should be able to distinguish between devices and operations of mechanical power, electrical power, and fluid power systems. The student should also be able to determine gear rotation, design and build a robotic arm, and build a "big track" robot. Competencies will be demonstrated by completing the assignment sheets, job sheets, and unit tests with a minimum of 85 percent.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- 1. Match terms related to power transmission and storage with the correct definitions.
- 2. Distinguish between the types of power systems.
- 3. Identify devices for control and transmission of mechanical power.
- 4. Complete statements concerning the transmission of electrical power.
- 5. Match devices for control of electrical power with the correct descriptions.
- 6. Select true statements concerning the principles of hydraulics.
- 7. Match the parts of a hydraulic system with the correct functions.
- 8. Arrange in order the steps in the operation of hydraulics.
- 9. List applications of hydraulic transmissions.

172

OBJECTIVE SHEET

- 10. Select advantages of hydraulic systems.
- 11. Identify connectors used in fluid power systems.
- 12. Distinguish between the two laws defining the principles of pneumatics.
- 13. Match parts of a pneumatic system with the correct functions.
- 14. List applications of pneumatics.
- 15. Match terms related to robotics with the correct definitions.
- 16. Distinguish between the two major categories of jobs in industry that are well suited for robots.
- 17. Complete statements concerning the principles of lasers.
- 18. Match classes of lasers with the correct descriptions
- 19. List applications of lasers.
- 20. Match types of energy with examples of their storage devices.
- 21. Determine gear rotation. (Assignment Sheet #1)
- 22. Design and build a robotic arm. (Assignment Sheet #2)
- 23. Demonstrate the ability to:
 - a. Build a "big track" robot. (Job Sheet #1)
 - b. Build a lemon battery. (Job Sheet #2)

POWER TRANSMISSION AND STORAGE UNIT IV

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Make transparencies from the transparency masters included with this unit.
- C. Provide students with objective sheet.
- D. Discuss unit and specific objectives.
- E. Provide students with information and assignment sheets.
- E. Discuss information and assignment shoats.

(NOTE: Use the transparencies to enhance the information as needed.)

- G. Provide students with job sheets.
- H. Discuss and demonstrate the procedures outlined in the job sheets.
- I. Integrate the following activities throughout the teaching of this unit:
 - 1. Show films dealing with power transmission and storage. Suggested films are listed on the next page.
 - 2. Arrange group tours to local manufacturing plant/s.
 - 3. Build a 90¢ continuity tester.
 - 4. Build a mousetrap vehicle to go along with gear rotation problems in Assignment Sheet #1.
 - 5. Make a block diagram showing TV waves in a transmission system.
 - 6. Add mechanical levers and/or electric motor to Assignment Sheet #2.
 - 7. Determine mechanical advantage of gears and levers.
 - 8. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.
- J. Give test.
- K. Evaluate test.
- L. Reteach if necessary.

POWER TRANSMISSION AND STORAGE UNIT IV

INFORMATION SHEET

I. Terms and definitions

- A. Accumulator An auxiliary storage place for hydraulic fluid under pressure which is used to dampen out pulsations or pressure surges that cause vibrations and uneven operation of hydraulic devices
- B. Actuator A fluid power device that changes fluid power to either rotary, linear, or reciprocating motion
- C. Hydraulics The use of a liquid, usually oil, to transmit power
- D. Laser (Light Amplification by Stimulated Emission of Radiation) A device that generates a concentrated beam of light that travels in very narrow straight path
- E. Pneumatics The use of compressed gases, usually air, to transmit power
- Robot Reprogrammable machine with an arm or hand that can pick up and move many things; may also be fitted with tools to perform other tasks
- G. Solld state Electronic circuits using semiconductor devices such as, transistors, diodes, and silicon-controlled rectifiers
- H. Transformer A device that transmits electrical power from one circuit to another
- I. Voltage The electromotive force which will cause current to flow

II. Types of power systems

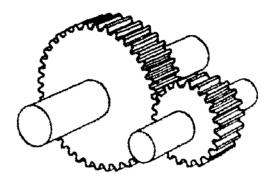

- A. Mechanical power Uses gears, pulleys, and chains for control and transmission of mechanical energy
- B. Electrical power Uses switches, relays, transformers, conductors, transmitters, and air for control and transmission of electric energy
- Fluid power Uses liquids and gases under pressure for control and transmission of fluid energy
 - 1. Hydraulic Fluid power using liquids (usually water or oil)
 - 2. Pneumatic Fluid power using gases (usually air)

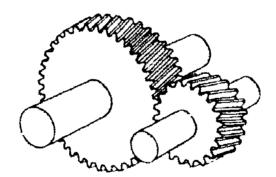

- III. Devices for control and transmission of mechanical power (Transparency 1)
 - A. Gears Are wheels that have teeth around their outside surface which mesh with the teeth of another gear.

(NOTE: The gear connected to the power source is called the drive gear. The second gear is called the driven gear.)

1. Spur gears — Simplest and most common type of gear. Teeth are cut parallel to shaft. Can provide changes in direction, force, or speed.

 Helical gears — Similar to spur gears except that teeth are cut at an angle. Can change power direction. Pairs can be used in parallel or right-angle positions.

3. Bevel gears — Used to change direction of power input or to increase force or speed when two different sizes of gears are used. May have straight or spiral-shaped (helical) teeth.

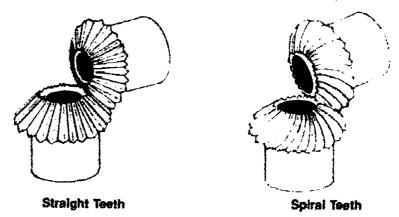

Plain Bevel

Spiral Bevel

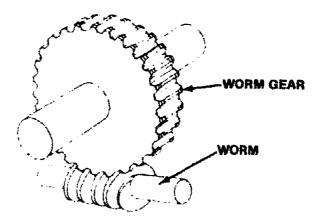

(NOTE: Gears can increase or decrease the turning effort. They also may be used to change speed. When a slowdown is needed, reduction gears are used. Multiplying gears increases output speed.)

4. Miter gears — Can only provide changes in direction. Cannot change force or speed because both gears have the same number of teeth (gear ratio of 1:1). May have straight or spiral-shaped teeth.

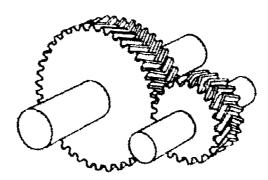

Miter Gear Sets

 Worm gears — A set consists of a worm and a worm gear. Worm gear rotates only one tooth each time the worm makes a full rotation. Can provide major changes in torque and speed or a change in direction.

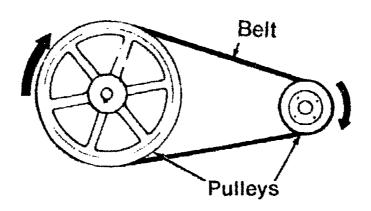

6. Herringbone gears — Are double helical gears with balanced thrusts because the teeth angles are reversed on opposite sides.

 Rack and pinion gears — Provide a special type of gear arrangement which transfers straight-line motion into rotary motion or rotary motion into straight-line motion.

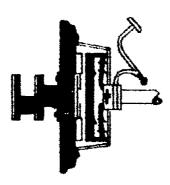

B. Pulleys and belts — Pulleys are usually metal grooved discs that drive or are driven by flexible belts. Mainly used to change — and speed.

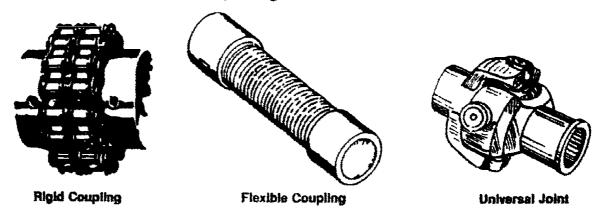

C. Sprockets and chains — Sprockets are similar to gears except that they drive or are driven by a chain instead of another gear. Can change force and spend. Do not change the direction of rotation as gears do.

D. Clutches — Devices that connect or disconnect the flow of power from one unit to another. May be several types such as friction clutches and centrifugal clutches.

E. Couplings — Permanent connections used to change directions or to connect lengths of shafts. May be rigid or flexible.

- IV. Transmission of electrical power (Transparencies 2 and 3)
 - A. Transmission through solids High voltage electricity generated at power plants is sent through transmission lines (conducting wires).
 - B. Transmission through air Electromagnetic waves are sent through the air.

Examples. Television signals, radio signals, microwaves

- V. Devices for control of electrical power (Transparency 4)
 - A. On-Off control devices (switches)
 - 1. Manual switch Most common electrical control device

Example: Common on-off light switch

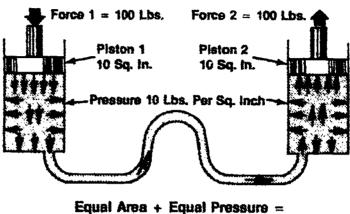

- 2. Relays Used to control a circuit from a remote location
- 3. Transistors Solid-state devices used for switching and/or amplifying the flow of electrons in a circuit
- B. Directional and overload control devices
 - 1. Diodes Permit current to flow in only one direction; solid state
 - 2. Fuses Protect a circuit from dangerous overloads; must be replaced after use
 - 3. Circuit breakers Have the same job as a fuse, but can be reset by hand after circuit is broken
- C. Current and voltage control devices
 - 1. Transformers Allow current to be stepped up or down
 - 2. Resistors Reduce current flow and control voltage drop

VI. Principles of hydraulics

- A. Pascal's Law Pressure set up in a confined liquid acts equally in all directions.
- B. Liquid cannot be compressed.
- C. Liquid can be used to transmit power.
- D. Liquid can be used to multiply force.

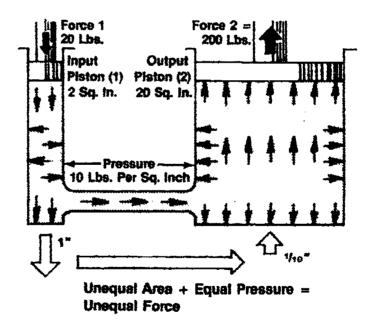

- E. Applications of these principles
 - If the input and output pistons have equal areas and equal pressures, the output force will be equal to the input force.

Equal Area + Equal Pressure : Equal Force

2. If the input and output pistons have unequal areas and equal pressures, the input and output forces will be unequal.

- Vil. Parts of a hydraulic system (Transparency 5)
 - A. Motor, turbine, or engine Drives the pump
 - B. Pump Supplies fluid under pressure to system
 - C. Reservoir or tank Stores the fluid

- D. Filter Cleans the fluid
- E. Pressure relief valve Opens to relieve excess pressure and to prevent damage to both the system and the surroundings
- F. Control valve Regulates fluid pressure, flow rate, and direction of flow (NOTE: Most systems have several control valves, each with specific purposes.)
- G. Cylinder Transfers fluid pressure in system to piston which pushes load; changes fluid pressure into mechanical motion

Viii. Operation of hydraulics

- A. Oil pump draws the oil from the reservoir.
- B. Oil passes to the chambers of a control valve.
- C. Oil is directed to double-acting cylinders.
- D. Hydraulic pressure causes the piston to move and perform work.

IX. Applications of hydraulic transmissions

- A. Automotive Power brakes, power windows, automatic transmissions, power steering, shock absorbers
- B. Manufacturing Machine tools, food and chemical processors, plastics, presses, loaders
- C. Aerospace Aircraft, lanuing gears, helicopters, satellites
- D. Agriculture Automatic bale loaders, machinery hoists, tractors, grain beds, pickers, threshers
- E. Construction Road graders, shovels, rock crushers, bulldozers

X. Advantages of hydraulic systems

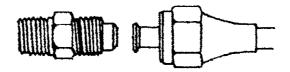

- A. Are simple having no gears or levers
- B. Require no lubrication
- C. Liquids are not subject to wear or breakage.
- D. Applied forces can be multiplied and transmitted in any direction and over considerable distance with little loss in efficiency.
- E. Transmitted motion is smooth and consistent.
- E. Closed or sealed system prevents entry of dirt and resulting wear.

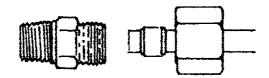

XI. Connectors used in fluid power systems

(NOTE: Connectors are a very important part of transmission lines. They are used to join the different parts of a fluid system.)

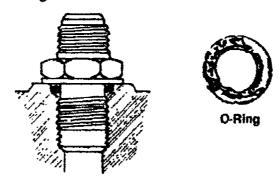

A. Flared tube fitting

B. Compression sleeve fitting

C. Fitting with O-ring seal

D. Quick-disconnect fitting with barbed fasteners

XII. Principles of pneumatics

- A. Boyle's law If the volume of air or gas in a cylinder is compressed to one-half or its original volume, its pressure will double.
- B. Charles' law When the volume of a gas remains constant and its temperature increases, the pressure increases proportionally.

Example: A sealed can will explode if it is heated sufficiently.

XIII. Parts of a pneumatic system (Transparency 5)

- A. Motor or engine Drives the air compressor
- B. Air compressor Increases the pressure of the air or gas
- C. Pressure relief valve Opens to relieve excess pressure
- D. Filter Removes dirt from the air
- E. Regulator Monitors and controls the desired air pressure in the line
- F. Lubricator Adds some oil to the air passing through and reduces friction between sliding surfaces
- G. Control valves Regulate flow rate and direction of air
- H. Cylinder or other actuator Converts pressure into mechanical motion

XIV. Applications of pneumatics

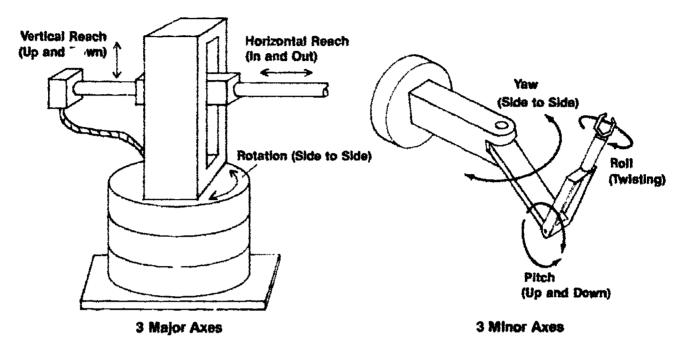

(NOTE: These are just a few of the many applications of pneumatics.)

- A. Aerosol-powered liquids Spray paint
- B. Die casting Forcing molten metal into molds
- C. Forging Shaping hard-to-work metal
- D. Aerospace Engine control units to correct yaw and pitch
- E. Transportation Tires and brake systems
- F. Pneumatic tools Air drills, staplers, riveting guns

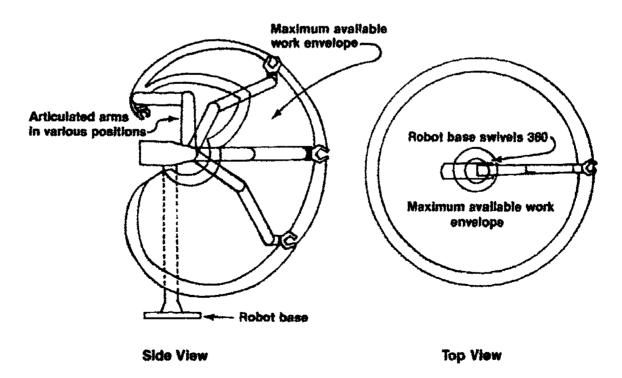

XV. Robotics terminology (Transparency 6)

A. Axes — The number of rotary center points on which motion is performed; may have 1-6 axes

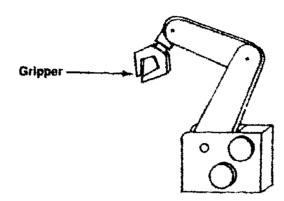

From Robotics and Automated Systems by Robert L. Hoekstra. Published by South-Western Publishing Co., #1986.

- B. Controller Part of the robot that directs the motion of the robot's manipulator
- C. Envelope The working area of the robot

D. Gripper — A handlike, pinching device that holds the part being moved or worked on or the tools doing the work

- E. Manipulator (arm) Part of the robot that is programmed to move and to pick up and place parts or hold tools for work procedures
- F. Power supply Supplies hydraulic, pneumatic, or elect in power to move the manipulator

XVI. Jobs well suited for robots

- A. Hazardous jobs Tasks that are dangerous or harmful to humans because of toxic fumes, temperature or weight of the material being handled, high levels of radiation, or danger working near rotating machinery
- B. Repetitive jobs Tasks that must be performed hundreds of times each day

(NOTE: A robot can perform these jobs without fatigue or boredom which helps to increase company productivity.)

XVII. Principles of lasers

- A. Laser beams consist of electromagnetic waves at or near the wavelength of visible light.
- B. The waves in a laser have almost identical lengths enabling it to travel in a straight line for miles with very little spreading.
- C. Laser wavelengths are very short and are measured in millionths of an inch.

(NOTE: Radio wavelengths are measured in yards, and television wavelengths are measured in feet.)

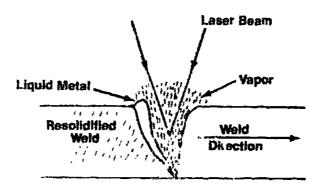

XVIII. Classes of lasers

- Class I Produce low powered light; cannot cause damage to anyone or anything
- B. Class II Can damage the eye only if the eye is celiberately exposed to the beam for periods of time longer than the normal blinking of the eye
- C. Class III Can produce light of high enough intensity to injure a human eye before the eye can blink
- D. Class IV Are a potential hazard to the eye and to exposed skin; can produce enough light energy to burn any combustible material

XIX. Applications of lasers

- A. In communications, lasers are used with fiberoptics to transmit telephone conversations.
- B. In industry, lasers are used to drill holes and braze or weld metals.

- C. In medicine, lasers are used to cut tissue and then seal tissues together so stitches are not needed.
- D. In construction, lasers are used with surveying equipment for more accurate measurements of distances and elevations.
- E. In consumer products, lasers are used to scan items in supermarket checkouts and video disks readers.

XX. Types of energy storage

- A. Mechanical energy
 - 1. Spring The stored potential energy in a "loaded" sprin (one that's stretched or compressed) can be recovered to do useful work.
 - 2. Flywheel A : ing flywheel stores energy that can be removed to do work.

B. Electrical energy

- Capacitors Store and discharge energy in an electrical system over long periods of time
- 2. Inductor Concentrate and store magnetic lines of force

C. Chemical energy

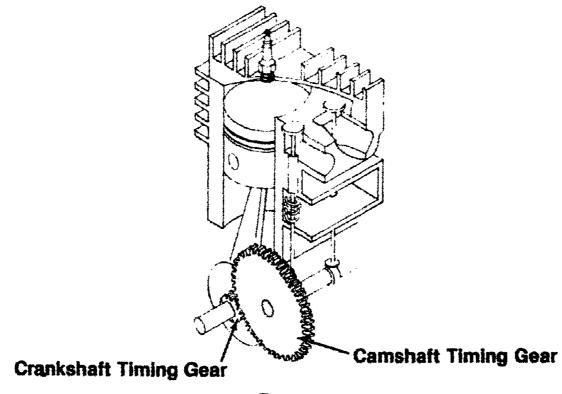

- 1. Fossil fuels Oil, coal, and natural gas are all chemicals or combinations of chemicals stored until released by burning.
- 2. Battery A device that converts stored chemical energy into electrical energy.

D. Fluid energy

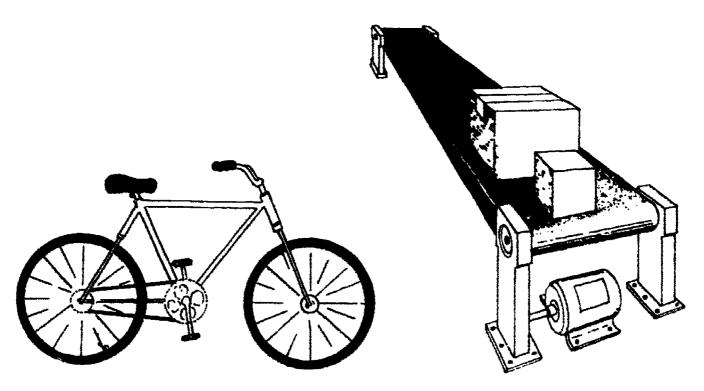

- 1. Air tank (compressed air) Potential energy stored in compressed air can be released as kinetic energy to produce work.
- 2. Accumulator (oil) A sealed tank that holds fluid under pressure as potential energy which can be released on demand.

A CONTROL OF BRIDE	A B C O SEN O SEN O O SEN O

POWER TRANSMISSION AND STORAGE UNIT IV

ASSIGNMENT SHEET #2 - DESIGN AND BUILD A ROBOTIC ARM

NAME	SCORE
1.	This exercise demonstrates the principles of hydraulics using syringes and tubing.
2.	Discuss the ways this system could be used to make a robot with one, two, three, four, or more axes.
3.	Plan to use basic materials, traditional tools, and techniques to produce a well-designed robot that teaches math and science principles as well as craftsmanship.
4,	There are no detailed plans with this activity in order to allow freedom of creativity.
5.	The specific dimensions are not important.
6 .	Syringes used in robot construction are one to sixty cubic centimeters (cc).
7.	Tubing is 1/8" tubing and can be purchased from local hardware store.
8.	Look at the following pictures. Then sketch your ideas and plan your robotic arm.

In building this robotic arm, observe your lab/classroom's safety rules.

In designing your robotic arm, use different types of power systems: mechanical,

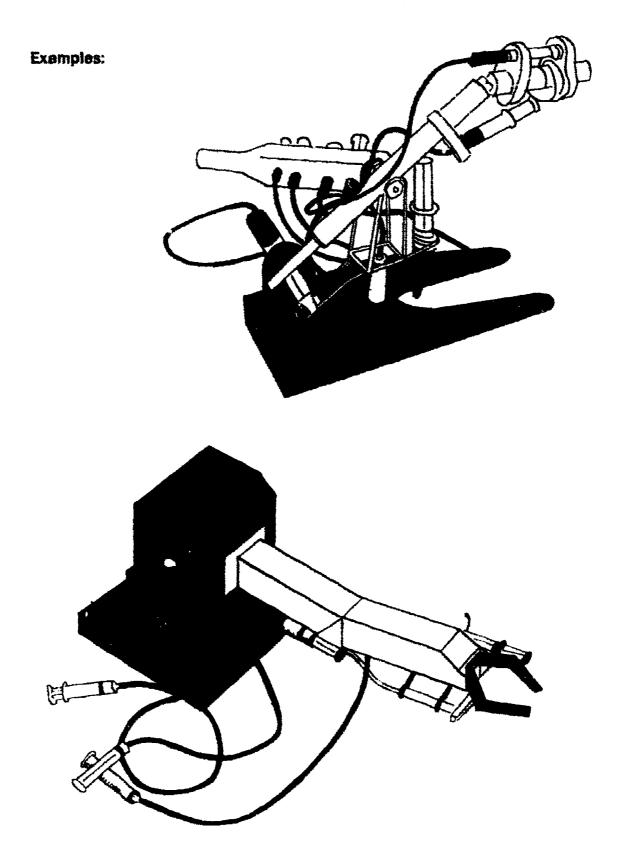

electrical, and fluid.

Assignment Sheet #2 — Evaluated to the satisfaction of the instructor

POWER TRANSMISSION AND STORAGE UNIT IV

JOB SHEET #1 - BUILD A "BIG TRACK" ROBOT

A. Tools and materials

- 1. 2 1" sections of 8-32 threaded rod with nuts (to mount wheels)
- 1 6-32 machine screw, nut, and washer (to mount battery switches)
 (NOTE: The length of screw needed will depend on the size of battery switches used.)
- 3. $1 \frac{1}{8} \times \frac{1}{2}$ inch RH wood screw (for negative battery terminal)
- 4. 4 4 penny finishing nails (for connection terminals)
- 5. 2 5/8 inch box nails (to connect skid block to strap)
- 6. 1 1/2 inch furniture glide (for skid)
- 7. $1 2^{1/2} \times {}^{3/8} \times {}^{1/16}$ inch strap of metal or plastic (for skid block)
- 8. $1 1\frac{1}{4} \times \frac{3}{8} \times 0.005$ inch brass shim (for battery switch)
- 9. $1 13/4 \times 3/4 \times 21/2$ inch wood skid block
- 10. 1 11/8 inch diameter x 1 inch wood dowel (for battery holder bottom)
- 11. 1 11/8 inch inside diameter x 5 inch plastic tube (for battery holder)
- 12. 16 feet of #30 wire-wrap wire
- 13. Foam tape (for tires)
- 14. Masking tape (to make wire into cable)
- 2 Wheel discs between 3" and 5" diameter of plastic, wood, or metal
 (NOTE: Mini Frisbees or plastic coasters work well.)
- 16. 2 DPDT momentary contact switches
- **17.** Epoxy
- 18. 2 "C" size dry cell batteries

JOB SHEET #1

19. "BIG TRACK" motor assembly

(NOTE: Known sources of supply are:

H & R Corporation 401 E. Erle Avenue Philadelphia, PA 19134 (Surplus electrical and mechanical equipment, BIG TRACK motors)

Martin P. Jones & Associaties P.O. Box 12685 Lake Park, FL 33403 (Surplus electronics) Edmund Scientific Co.
101 E. Gloucester Pike
Barrington, NJ 08007
(Variety of supplies including
some surplus BIG TRACK motors)

JERRYCO Inc. 601 Linden Place Evanston, IL 60202 (Surplus electronic and mechanical equipment)

B. Procedure

1. Check motors and connections in BIG TRACK motor unit with a multimeter.

(NOTE: The winding resistance is about 4 ohms. It may be necessary to rotate the motor chaft to get a true reading.)

2. Slip sections of 8-32 threaded rod inside tubing axles on BIG TRACK motor unit.

(NOTE: If the inside diameter of the axle is too small, it can be enlarged with a 11/32 drill.)

- Glue threaded rod into axle with epoxy.
- 4. Cut plywood disks if using wooden wheels, with a fly cutter.

(NOTE: If wooden wheels are used, foam tape can be added to outer surface to provide by ter traction.)

5. Drill center holes in wheel disks.

(NOTE: A corner jig on a d....l press may make it easier for students to accurately center holes.)

- 6. Cut 11/a" plastic tubing into 5" length.
- 7. Cut 1" wooden plug from 11/8" dowel.
- 8. Drill hole in plug to pass wire through.
- 9. Drive brass screw into one end of plug, holding wire end under it.
- 10. Test connection with multimeter.

JOB SHEET #1

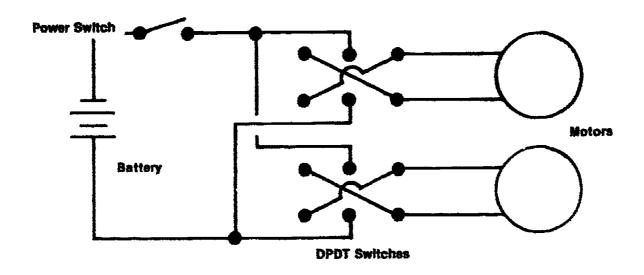

- 11. Push plug into the end of plastic tube.
- 12. Secure by driving two 1/2" nalls in, taking care not to drive nails through wire.
- 13. Punch 1/8" hole in brass shim stock about 1/4" from the end.
- 14. Punch another 1/e" hole 1/4" from the end of the plastic tube.
- 15. Fasten together tube, shim stock, and wire with a 6-32 inch screw, nut, and washer.
- 16. Test connections with a multimeter.
- 17. Tape together wires from battery terminals about every 6 inches to form a cable.
- 18. Mark screw holes in strap for mid-line attachment at two screws nearest the motors.
- 19. Drill holes in strap.
- 20. File out side of strap to accommodate bulges in motor housing between screws.
- 21. Drill two holes in strap to nail strap to wooden block.
- 22. Drive furniture glide into one side of wooden block.
- 23. Mount connectors from motor wires to control cable on opposite side of wood block.
- 24. Drive in 4 penny finishing nails to connect motor wires to cable, in pattern that matches motor wires.
- 25. Cut off nail heads after driving them in.
- 26. Nail strap onto block.
- 27. Strip 1/2" of insulation from each end of four 5' pieces of wire-wrapre.
- 28. Wrap one end of wire to each of four nails in skid assembly block.
- 29. Solder each wire to nail.
- 30. Attach motor leads to nails.
- 31. Mark each free end of wire attached to nail so it can be identified with motor lead to which it is attached.
- 32. Tape wires every 6" to form cable.

JOB SHEET #1

- 33. Check connections with multimeter.
- 34. Remove spring locks from (2) DPDT switches.
- 35. Connect switches as shown. (Figure 1)

FIGURE 1

- 36. Put 2 "C" dry cell batteries in case.
- 37. Test "Big Track" robot.
- 38. Fleid test robot by running it through an obstacle course.

POWER TRANSMISSION AND STORAGE UNIT IV

JOB SHEET #2 — BUILD A LEMON BATTERY

DIME

PENNY

Tools and materials

- 1. Galvanometer
- 2. Knife
- 3. Lemon
- Penny
- 5. Nickle or dime
- 6. Fine abrasive paper
- 7. Hookup wire

B. **Procedure**

- 1. Make two small slits in the lemon (1 cm long, 1 cm deep, 2 cm apart).
- 2. Clean both sides of the two coins thoroughly using the fine abrasive paper.
- 3. Insert the two coins into the two slits so that both stick out a little bit.
- 4. Attach one galvanometer lead to the dime.
- 5. Read the meter. What does it read? _____
- 6. Attach the other lead to the penny.
- 7. Read the meter again. What does it read now?

Battery case	Proper length/ Plug fits well	Proper length/ Plug slightly off	Case too long! Plug slightly off	Case too short/ Plug off
	4	3	2	1
Skid and Motor Unit	Skid attached properly to motor unit	Skid attachment needs minor adjustment	Skid attachment needs major adjustment	Attachment needs to be redone
	4	3	2	1
Cable	Proper length/ Connections check OK	Connections OK	Cable too short/ Connections OK	Cable too short Connections don't check out
	4	3	2	1
Switch	Work properly	Wiring needs minor adjustment	Wiring needs major adjustment	Switches won't work

PERFORMANCE EVALUATION KEY

- Skilled Can perform job with no additional training.
- Moderately skilled Has performed job during training program; limited additional training may be required.

 Limited skill Has performed job during training program; additional
- training is required to develop skill.
- 1 Unskilled Is familiar with process, but is unable to perform job.

(EVALUATOR NOTE: If an average score is needed to coincide with a competency profile, total the designated points in "Product Evaluation" and divide by he total number of criteria.)

		TEST	
1.	Match the	terms on the right with the correct definitions.	
	a.	A device that transmits electrical power from one circuit to another	1. Accumulator
	b.	The electromotive force which will cause	2. Actuator
		current to flow	3. Hydraulics
	c.	An auxiliary storage place for hydraulic fluid under pressure which is used to dampen out	4. Laser
		pulsations or pressure surges that cause vibrations and uneven operation of hydrau-	5. Pneumatics
		lic devices	6. Robot
	d.	Reprogrammable machine with an arm or hand that can pick up and move many	7. Solid state
		things; may also be fitted with tools to perform other tasks	8. Transformer
	e.	A fluid power device that changes fluid power to either rotary, linear, or reciprocating motion	9. Voltage
	f.	Electronic circuits using semiconductor devices such as transistors, diodes, and silicon-controlled rectifiers	
	g.	The use of a liquid, usually oil, to transmit power	
	h.	A device that generates a concentrated beam of light that travels in a very narrow straight path	
2.	Distinguish the correct	between types of power systems by placing an descriptions of electrical, mechanical, or fluid p	"E", "M", or "F" in front of ower systems.
	a,	Uses gears, pulleys, and chains for control and	transmission of energy
	b.	Uses liquids and gases under pressure for co energy	entrol and transmission of
	c.	Uses switches relays, transformers, conductor control and transmission of energy	s, transmitters, and air for

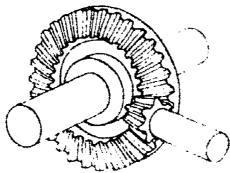

3. Identify devices for control and transmission of mechanical power by placing the appropriate number beside each picture.

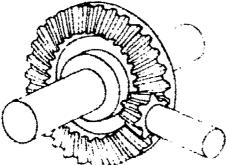

_a,

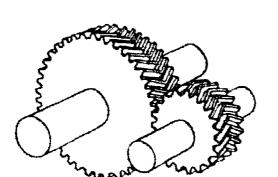

_b.

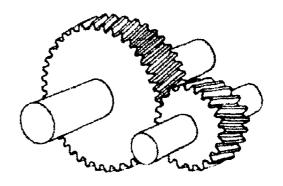

_C.

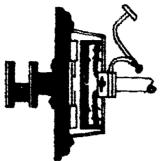

_d.

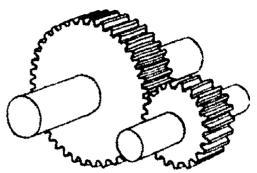

- 1. Belt and pulley
- 2. Bevel gear
- 3. Chain and sprocket
- 4. Clutch
- 5. Couplings
- 6. Helical gear
- 7. Herringbone gear
- 8. Miter gear
- 9. Rack and pinion gear
- 10. Spur gear
- 11. Worm gear

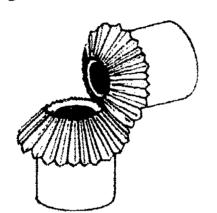

____е.

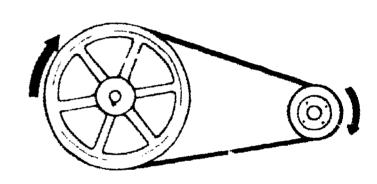

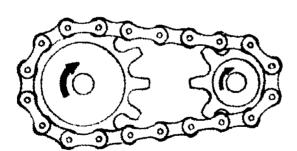

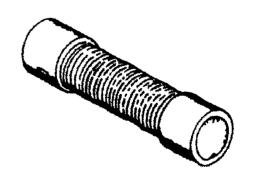

____h

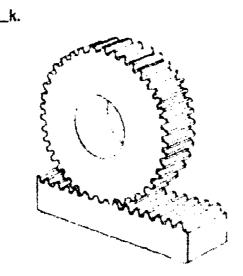

_____j.

____j.

- 4. Complete the following statements concerning the transmission of electrical power by circling the correct words.
 - a. Transmission through solids is (low, high) voltage electricity generated at power plants sent through transmission lines.
 - b. Transmission through air is electromagnetic waves sent through the air. An example of this type of transmission is (television, telegraph) signals.
- 5. Match devices for control of electrical power on the right with the correct descriptions.

a.	Solid state devices used for switching and/ or amplifying the flow of electrons in a cir-		Circuit breakers
	cuit	2.	Diodes
b.	Used to control a circuit from a remote tocation	3.	Fuses
	•• • • • • • • • • • • • • • • • • • • •	4.	Manual switch
c.	Most common electrical control device	_	Dolovo
d.	Reduce current flow and control voltage	3.	Relays
-	drop	6.	Resistors
	Have the same job as a fuse, but can be reset by hand after circuit is broken	7.	Transformers
		8.	Transistors
f.	Permit current to flow in only one direction; solid state		
9.	Allow current to be stepped up or down		
h.	Protect a circuit from dangerous overloads; must be replaced after use		

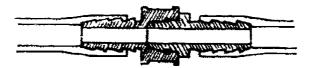

6.	Select true in the app	e statements concerning the principles of hydrau propriate blank.	ilies by placing a "T" or "F
	a.	Liquid can be compressed like a gas.	
	b.	Pressure set up in a confined liquid acts equi	ally in all directions.
	c.	If the input and output pistons have equal are output force will be equal to the input force.	as and equal pressures, the
7.	Match the	parts of a hydraulic system on the right with th	e correct functions.
	a.	Drives the pump	1. Control valve
	b.	Supplies fluid under pressure to system	2. Cylinder
	c.	Stores the fluid	3. Filter
	d.	Cleans the fluid	4. Motor, turbine, or engine
		Opens to relieve excess pressure and to prevent damage to both the system and the surroundings	5. Pressure relief valve
	f,	Regulates fluid pressure, flow rate, and	6. Pump
		direction of flow	7. Reservoir or tank
	9	Transfers fluid pressure in system to piston which pushes load; changes fluid pressure into mechanical motion	
8.	Arrange in correct sec	order the steps in the operation of hydrautics by quence.	placing numbers 1-4 in the
	a.	Hydraulic pressure causes the piston to move	and perform work.
	b.	Oil pump draws the oil from the reservoir.	
	c.	Oil is directed to double-acting cylinders.	
	d.	Oil passes to the chambers of a control valve.	
€.	List two ap	phications of hydraulic transmissions in each of	the following areas.
	a. Auto	motive —	
	b. Man	ufacturing —	
		space —	
		culture —	
		struction —	

10.	Select adva	antages of a hy s.	draulic sy	stem by pla	cing an "A" i	n fi	ront of the	e app r	opriate
	a.	Liquids are n	ot subject	to wear or	breakage.				
	b.	Require no lu	brication						
	c.	Transmitted r	notion is s	smooth and	consistent.				
	d.	Restricted to	certain ar	eas/condition	ons.				
		Are simple ha	aving no g	ears or leve	rs				
	f.	Closed or sea	aled syste	m prevents	entry of dirt	ano	i resulting	g wear	:

	c.								
				}_					

U.

12.	Distinguish between the two laws defining the principles of pneumatics by placing a "B" in front of Boyle's law and a "C" in front of Charles' law.				
	a.	If the volume of air or gas in a cylinder is con original volume, its pressure will double.	ompressed to one-half of its		
	b.	When the volume of a gas remains constincreases, the pressure increases proportional		and its temperature	
13.	Match parts of a pneumatic system on the right with the correct functions.				
	a.	Drives the air compressor	1.	Air compressor	
	b.	Increases the pressure of the air or gas	2.	Control valve	
	c.	Opens to relieve excess pressure	3.	Cylinder or other	
	d.	Removes dirt from the air	A	actuator	
	е.	Monitors and controls the desired air pres- sure in the line		Lubricator	
	f.	Adds some oil to the air passing through and reduces friction between sliding sur-	6.	Motor or engine	
		faces	7.	Pressure relief valve	
	g.	Regulates flow rate and direction of air	8.	Regulator	
	h.	Converts pressure into mechanical motion			
14.	List four applications of pneumatics.				
	a				
	b				
	c				
	d				

TEST

15.	Matc	h term	is related to robotics listed on the right with the	rect definitions.				
		_a.	The working area of the robot		Axos			
		_b.	b. Supplies hydraulic, pneumatic, or electric power to move the manipulator	2.	Controller			
				3.	Envelope			
	***************************************	_c.	A handlike, pinching device that holds the part being moved or worked on or the tools doing the work		Gripper			
				5.	Manipulator			
		_ d .	The number of rotary center points on which motion is performed; may have 1-6 of these	6.	er supply			
		_e.	Part of the robot that is programmed to move and to pick up and place parts or hold tools for work procedures					
		_f .	Part of the robot that directs the motion of the robot's manipulator					
16.	by pl	Distinguish between the two major categories of jubs in industry well suited for robots by placing an "X" next to the description of repetitive jobs and an "O" next to the hazardous jobs.						
		a. Tasks that must be performed hundreds of t		imes each day				
	,	b. Tasks that are dangerous or harmful to humans because of toxic fumes high levels of radiation, etc.						
17.	-	Complete statements concerning the principles of lasers by circling the appropriate words.						
	a.	a. Laser beams consist of (telegraphic, electromagnetic) waves at or near the wave- length of visible light.						
	b.	. The waves in a laser have almost identical lengths enabling it to travel in a straight line for miles with (a great deal of, very little) spreading.						
	c.	Laser	r wavelengths are very (short, long).					

TEST

18.	Matc	Match classes of lasers on the right with the correct descriptions.					
		_a.	Are a potential hazard to the eye and to exposed skin; can produce enough light energy to burn any combustible material	1. Class I			
	b.		Produce low powered light; cannot cause damage to anyone or anything	3. Class III 4. Class IV			
		_c.	Can damage the eye only if the eye is delib- erately exposed to the beam for periods of time longer than the normal blinking of the eye	4. Class IV			
	Marinia de la comp	_d.	Can produce light of high enough intensity to injure a human eye before the eye can blink				
19.	List f	our app	olications of lasers.				
	a.	-					
	D.						
	C.						
	d.	~ ~~~					
20.	Matcl	types	of energy on the right with the correct example	s of storage devices.			
		_a,	Springs and flywheels	1. Fluid energy

 - C. 2
 - 3 d.

ANSWERS TO TEST

- 19. Any four of the following:
 - a. In communications, lasers are used with fiberoptics to transmit telephone conversations.
 - b. In industry, lasers are used to drill holes and braze or weld metals.
 - c. In medicine, lasers are used to cut tissue and then seal tissues together so stitches are not needed.
 - d. In construction, lasers are used with surveying equipment for more accurate measurements of distances and elevations.
 - e. In consumer products, lasers are used to scan items in supermarket checkouts and video disks readers.
- 20. a. 3
 - b. 2
 - c. 4
 - d. 1
- 21,-22. Evaluated to the satisfaction of the instructor
 - 23. Performance skills evaluated to the satisfaction of the instructor

TRANSPORTATION SYSTEMS UNIT V

UNIT OBJECTIVE

After completion of this unit, the student should be able to distinguish between the modes of transportation, select appropriate modes of transportation for given situations, and set up and operate a pipeline simulation. Competencies will be demonstrated by completing the assignment sheet, job sheet, and unit tests with a minimum of 85 percent.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- 1. Match terms related to transportation systems with the correct definitions.
- 2. List the four basic modes of transportation.
- 3. Match types of intermodal transportation with their uses.
- 4. Complete statements concerning the types of on-site transportation.
- 5. Complete statements concerning highway transportation.
- 6. Complete statements concerning rail transportation.
- 7. Identify types of railway vehicles.
- 8. Match types of commercial airlines with the correct descriptions.
- 9. Distinguish between the basic types of airplanes.
- 10. Identify parts of an airplane.
- 11. Complete statements concerning space transportation.

OBJECTIVE SHEET

- 12. Match U.S. space projects with their contributions.
- 13. Complete statements concerning characteristics of the space shuttle.
- 14. Match basic vessels for water transportation with the correct descriptions.
- 15. Identify the basic parts of a ship.
- 16. List uses of computers for transportation systems.
- 17. Select modes of transportation for given situations. (Assignment Sheet #1)
- 18. Demonstrate the ability to set up and operate a pipeline simulation. (Job Sheet #1)

TRANSPORTATION SYSTEMS UNIT V

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Make transparencies from the transparency masters included with this unit.
- C. Provide students with objective sheet.
- D. Discuss unit and specific objectives.
- E. Provide students with information and assignment sheets.
- F. Discuss information and assignment sheets.

(NOTE: Use the transparency to enhance the information as needed.)

- G. Provide students with job sheet.
- H. Discuss and demonstrate the procedure outlined in the job sheet.
- I. Integrate the following activities throughout the teaching of this unit:
 - 1. Show films on transportation. Suggested films are listed on the next page.
 - 2. Invite a travel agent to present a discussion on air travel. Include cost, schedules, service, and airlines companies in the presentation.
 - 3. Invite a representative from a local pipeline or utility company to discuss the operation of a pipeline system. Include planning, organization, and controlling the product as they travel through the lines.
 - 4. Discuss the advantages and disadvantages of each mode of transportation. Consider economics, speed, and environmental factors.
 - 5. Discuss the different kinds of city, state, and federal government vehicles that are used in your community.
 - 6. Using local telephone books, have students locate and list the different small package express companies that serve your area.
 - 7. Trace a consumable food product through the different types of transportation involved in getting that product from the fields to the table.

SUGGESTED ACTIVITIES

- B. Discuss how products such as televisions, refrigerators, stoves, hair dryers, radios, and other household goods get from the manufacturers to retail stores to consumers.
- 9. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.
- J. Give test.
- K. Evaluate test.
- L. Reteach if necessary.

TRANSPORTATION SYSTEMS UNIT V

INFORMATION SHEET

I. Terms and definitions

- A. Cargo/freight Solid, liquid, or gaseous material being moved from one place to another
- B. Intercity Between cities
- C. Intermodal transportation Moving passengers or cargo using more than one mode or method
- D. Interstate Between states
- E. Intracity Within the city

Intrastate - Within the state

- G. On-site transportation Moving people and/or materials over short distances within one particular area or building
- H. Passengers People who are being transported from place to place
- Terminals The beginning and ending points for loading and unloading passengers and cargo
- J. Transportation The movement of people and material
- K. Vehicles Transportation devices

Examples: Buses, cars, trucks, airplanes, railroad cars

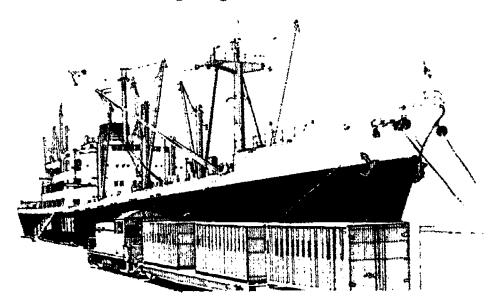

II. Basic modes of transportation (Transparency 1)

- A. Land
- B. Water
- C. Air
- D. Space

III. Types of intermodal transportation

A. Containerization — Shipping goods in large boxes which can be filled at one location, transported via different modes, and delivered to its destination without rehandling the goods

B. Freight forwarders — The middle persons in transportation who collect small loads from shippers, consolidate them into a large load, and forward the large load to the next receiver

Examples: Mistletoe, Beaver Express

C. Small package express service — The delivery of packages or parcels in the fastest and most direct way possible

Examples: U.P.S., Federal Express, Air Express

IV. Types of on-site transportation (Transparency 2)

- A. Materials handling Movement of raw and finished products inside the building using conveyors, cranes and hoists, industrial trucks, and fork lifts
- B. People moving Movement of individuals inside the building using escalators, elevators, and moving sidewalks

V. High way transportation (Transparency 3)

- A. Highways are used to move people and materials.
 - 1. Moving people
 - a. Personal transportation Automobiles and trucks are used to move people to and from their work places and for recreation activities.

(NOTE: People may also use specialized vehicles such as recreational vehicles [RVs] for their own use.)

 Commercial and government transportation — Buses and taxis are primarily used to move people intracity, intercity, and interstate for commercial profit or public service.

2. Moving materials

a. Personal transportation — Automobiles and trucks may be used to move materials for an individual's own use.

Examples: Groceries, household purchases

b. Commercial transportation — Trucks, vans, and tractor-trailer combinations are primarily used to haul materials for profit.

Examples: Refrigerated trailers are used to transport food items that may spoil, vans are used by appliance repair firms, tankers are used to transport Ilquid freight

B. Highways form an elaborate network of local, state, and interstate highways which connect all locations of the nation.

(NOTE: These interconnections make highway transportation a very flexible form of transportation. If you have a vehicle and a license to operate that vehicle, you can travel in the United States when and where you wish.)

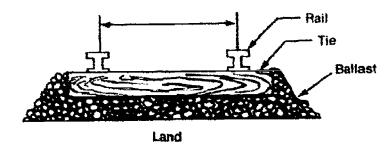

VI. Rail transportation

- A. Primarily used for commercial transportation of passengers and freight over long distances.
 - Examples of commercial passenger lines Amtrak and rapid transit trains
 - Examples of commercial freight lines B & O, Santa Fe, and Union Pacific

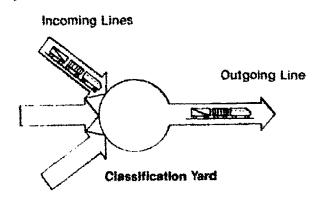

- B. Railway systems consist of the railways and the buildings and areas used to classify, schedule, and maintain vehicles.
 - A railway has four parts Right-of-way land, ballast, ties (or crossties) and rails

(NOTE: All railroad tracks in North America are built to a standard gauge [width apart] of 4'81/2" so rails can be shared by all companies.)

- 2. Stations For loading and unloading passengers
- 3. Freight terminals For loading and unloading freight
- Classification yards Complexes of tracks for joining railroad cars or for breaking up and regrouping cars to make more efficient use of the railways

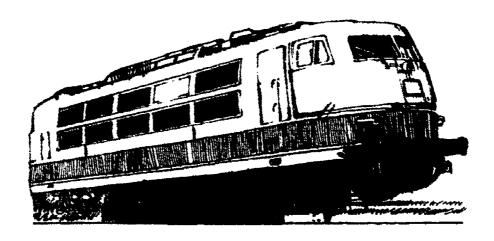

- 5. Control center For monitoring the switching of trains and cars by dispatchers
- 6. Engine/car shops For major repairs and maintenance work

VII. Types of railway vehicles

A. Locomotives — Power the train

- Most locomotive engines today are diesel-electric which use diesel fuel to power generators that supply electricity to traction motors that drive the wheels.
- 2. Other types include steam engines, gas turbine engines, and all electric engines.
- B. Passenger cars Carry passengers

- C. Freight cars Carry various types of freight
 - 1. Standard flat car

2. Standard gondola car

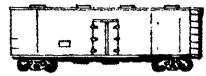

- 3. Single deck livestock car
- 4. Standard refrigerator car

5. Box car

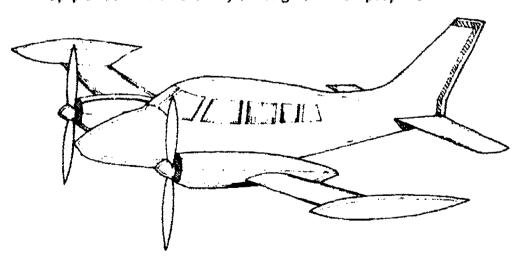

VIII. Types of commercial airlines

- A. Nonscheduled Charter planes
- B. Scheduled
 - 1. International Fly between U.S. and other countries
 - 2. Domestic Fly to and from major airports of the U.S.
 - 3. Regional Fly only specific regions of the U.S.
 - 4. Commuter Fly from smaller towns and cities to major airports in the U.S.

IX. Types of airplanes

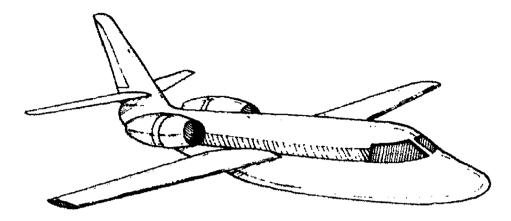

A. Prop planes — Powered by an engine-driven propeller

(NOTE: Propeller engines are very efficient at speeds below 560 kph [350 mph]. As speed increases above that, efficiency drops off.)

B. Jet planes - Powered by jet engines

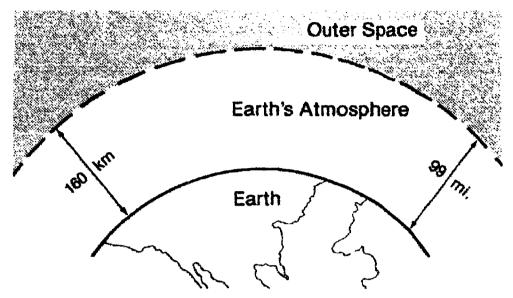

(NOTE: Jet engines are more efficient at high speeds.)

- X. Parts of an airplane (Transparency 4)
 - A. Fuselage Body of the airplane; holds the passengers and/or cargo
 - B. Engine (piston or jet) Powers the airplane
 - C. Wing assembly Provides lift to keep airplane airborne
 - 1. Wings
 - 2. Flaps
 - 3. Allerons
 - D. Tail assembly (empennage) Controls direction of airplane
 - 1. Vertical stabilizer
 - 2. Rudder
 - 3. Horizontal stabilizer
 - 4. Elevator
 - E. Landing gear Allows for physical contact with the ground

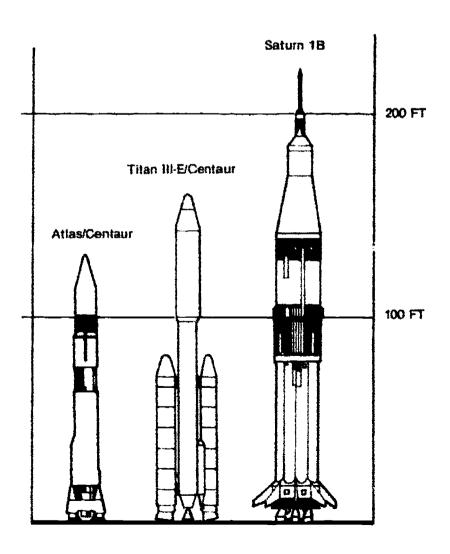

XI. Space transportation

A. Is an exploration of the region outside the earth's atmosphere

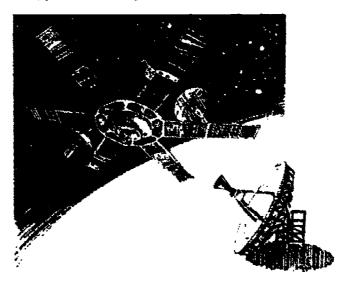

- 3. Use rocket engines which carry their own fuel and oxygen supplies.
- C. Use large launch vehicles to place spacecraft into orbit.

- D. Spacecraft are classified as manned or unmanned.
 - 1. The first man-made satellite was put into orbit on October 4, 1957 by the U.S.S.R. It was called Sputnik.
 - 2. Unmanned space vehicles are used for communication, weather forecasting, and military reconnaissance.

- 3. The first person in space was Russian cosmonaut Yuri Gagarin on April 12, 1961. He orbited the earth one time.
- 4. The United States followed closely after this with manned flights by American astronauts Alan Shepard, Virgil Grissom, and John Glenn.

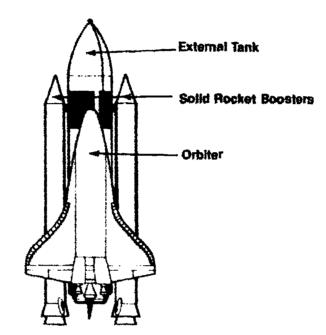

XII. U.S. space projects (1961-present) (Transparency 5)

- A. Mercury (1961-63) Put first American in space; had six, one-manned flights
- B. Gemini (1965-66) Orbited astronauts around the earth; accomplished docking and rendevous procedures; had ten, two-manned flights
- C. Apollo (1967-1972) Put first Americans on the moon (1969); had eleven three-manned flights; conducted lunar (moon) walks and experiments
- D. Skylab (1973-1979) Made transition from space exploration to space utilization; was a space station for experiments that stayed in orbit for more than 6 years; 4 manned missions were made to Skylab.
- E. Space shuttle (1976-Present) Developed a space vehicle that could be reused

XIII. Characteristics of the space shuttle

- A. There are four major elements in the shuttle system.
 - The orbiter (shuttle) Reusable aircraft resembling a jetliner
 Examples: Enterprise, Columbia, Challenger
 - 2. External tank Holds the liquid propellants for main engines
 - 3. Two solid rocket boosters Recoverable and reusable

B. Shuttle is launched vertically as its own liquid fuel rocket engines fire with the solid rocket boosters.

(NOTE: The boosters are dropped off and recovered for reuse.)

- C. The shuttle can carry up to seven people into orbit and up to 65,000 !bs. of cargo such as satellites, replacement parts, and other equipment. It also has a manipulator arm that serves many functions, including retrieving satellites in need of repair.
- D. The shuttle reenters the atmosphere and descends as a glider.

XIV. Basic vessels used for water transportation

A. Boats — Smaller watercraft propelled by oars, sails, or engines for recreational or commercial use

Examples: Ski boats, fishing boats, tugboats

B. Ships — Larger watercraft propelled by engines for commercial transportation of people or cargo

Examples: Luxury ocean liners, freighters

- C. Barges Flat, commercial cargo vessels that are pushed or pulled by engine-driven vessels (tugboats or towboats)
- D. Military vessels Vessels used by U.S. armed forces (especially the Navy) for defense and service of the country

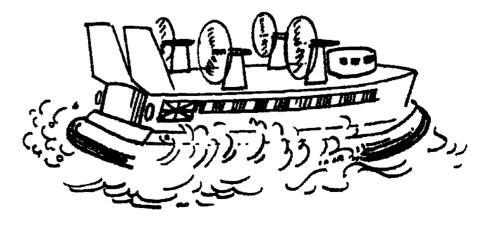

Examples: Aircraft carriers, patrol boats, submarines, battleships

- E. Specialized craft Hydrofoils and hovercrafts
 - 1. Hydrofoils Crafts supported on wings (foils) that create lift for the boat by deflecting water over their surfaces

Hydrofoll

 Hovercrafts — Vehicles that rely on a cushion of air between the hull or body and the surfaces over which it operates; can travel over land or water

Hovercraft

XV. Basic parts of a ship (Transparency 6)

- A. Hull Shell or plating
- B. Keel Lowermost part running the length of the ship
- C. Bow Forward end
- D. Stern Back section
- E. Bridge Control room
- F. Decks Layers or levels; main deck is uppermost

XVI. Uses of computers in transportation systems

- A. Highway transportation
 - 1. Vehicle production and assembly
 - 2. Computerized ignition systems
 - 3. Computerized diagnostic and test equipment
 - 4. Computer controlled traffic flow
 - 5. Law enforcement
 - 6. Trucking company recordkeeping
- B. Rail transportation
 - 1. Customer billing
 - 2. Reservations on passengers trains
 - 3. Switching operations
 - 4. Car identification
- C. Air transportation
 - 1. Airplane design
 - 2. Air traffic control
 - 3. Airplane gauges and controls
 - 4. Airline reservations

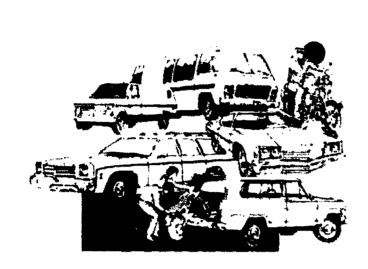

- D. Space transportation
 - 1. Tracking space vehicles
 - 2. On-board navigation guidance systems
 - 3. On-board communication systems
 - 4. Life support monitoring
 - 5. Launching operations

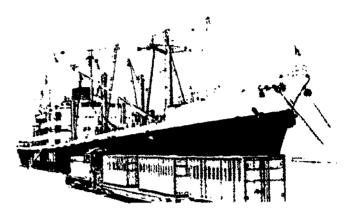

(NOTE: Space travel would be impossible without computers.)

- E. Water transportation
 - 1. Navigation
 - 2. Scheduling passengers or cargo
- F. Stationary transportation
 - Controlling speed and distribution of products for pipelines and conveyors
 - 2. Monitoring load requirements in elevators and escalators

SCORE _____

TRANSPORTATION SYSTEMS UNIT V

ASSIGNMENT SHEET #1 — SELECT MODES OF TRANSPORTATION FOR GIVEN SITUATIONS

A.	Directions: There are many factors to consider when choosing the mode of transporta- tion you will use to carry cargo. You will examine several of these factors, then make a decision regarding which mode to use in a given situation.
B.	Problem: Assume that you have a one-and-one-half ton load of break bulk cargo that you need to move from New Orleans, Louisiana to New York City, New York. You may choose between four modes of commercial transportation. You call four different com-

panies. They each quote you a price for their services and tell you how much time it will

Speedy Shipping — \$78 per ton, 7 days Rapid Railroad — \$156 per ton, 31/2 days Fast Trucking — \$247 per ton, 35 hours Lightning Air Cargo — \$2500 per ton, 21/2 hours

take. The shipping costs and times for each company are:

NAME _____

C. Procedure:

1. Calculate the cost for each mode. Write your answers in the proper spaces on Figure 1.

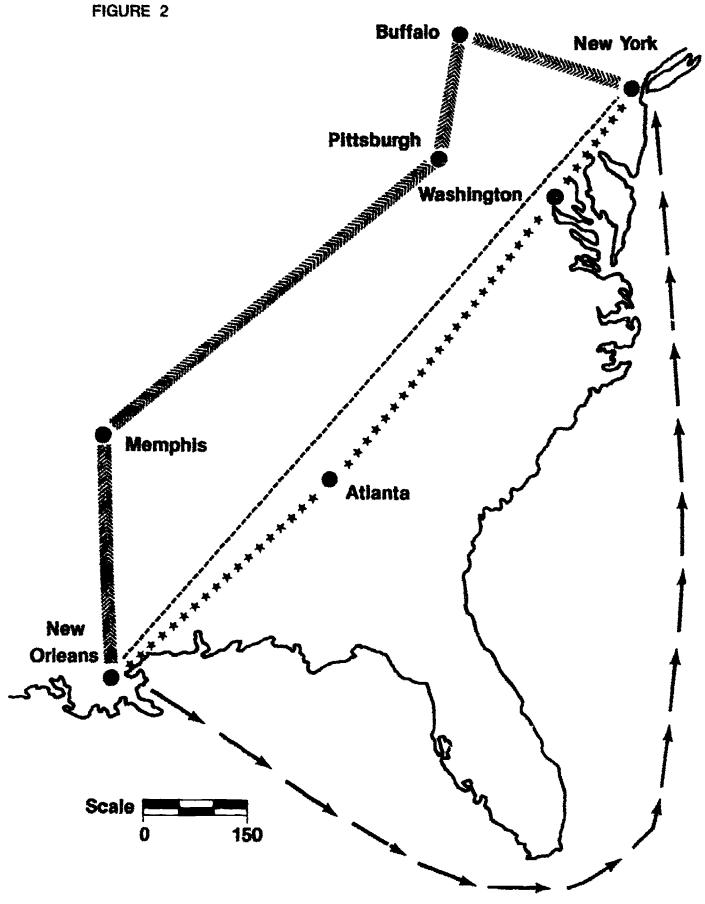

FIGURE 1

Mode	Route	Company	Cost	Time	Distance	Average Speed
Ship		Speedy Shipping				
Rail		Rapid Railroad				
Truck	****	Fast Trucking				_
Air		Lightning Air Cargo				

- 2. Calculate the time in hours for each mode. Write your answers on the same chart.
- 3. Measure each carrier's route and determine the distance in miles, using a ruler and the map, Figure 2. Write your answers on the chart.

ASSIGNMENT SHEET #1

From Energy, Power, and Transportation Technology Activity Guide by Raiph C. Bohn, et. al. Reprinted with permission of Bennett & McKnight, a division of Glencoe Publishing Company.

ASSIGNMENT SHEET #1

4. Calculate the average speed of each mode using the formula:

a. Speed =
$$\frac{\text{Distance}}{\text{Time}}$$

- b. Write your answers on the chart. (Figure 1)
- 5. Study Figure 3. Think about each type of cargo, and decide which mode of transportation you would use to transport each type of cargo from your present community to New York City. Tell why you would use it. Write your answers in the proper spaces on the following chart.

FIGURE 3

Cargo To Be Shipped	Mode	Reason
Human heart for transplant		
Lumber		
New motorcycles		
Children's clothing		
Fresh fruits	·	
Computers		

TRANSPORTATION SYSTEMS UNIT V

ANSWERS TO ASSIGNMENT SHEET #1

FIGURE 1

Mode	Route	Company	Cost	Time	Distance	Average Speed
Ship	-	Speedy Shipping	\$117.00	7 days	2025	289.3 mpd
Rail	WW85Wb	Rapid Railroad	\$234.00	31/2 days	1500	428.6 mpd
Truck	***	Fast Trucking	\$370.50	35 hrs.	1220	34.9 mph
Air		Lightning Air Cargo	\$3750.00	21/2 hrs.	1200	480 mph

FIGURE 3 — Answers will vary. All modes may not be feasible in your area. The human heart should be transported by air because of the need for speed in a life and death situation. The fresh fruits may also need to be sent by air depending on distance to New York. All other products should be sent by less expensive modes — truck, ship, or train, depending on access to these modes in your area.

TRANSPORTATION SYSTEMS UNIT V

JOB SHEET #1 — SET UP AND OPERATE A PIPELINE SIMULATION

Different products are pumped through pipeline in "batches." Petroleum products in neighboring "batches" must have different viscosities (thicknesses). At the final destination the pure parts of each batch are ready to use, but the intermixed parts must be stored and allowed to settle. Then these can be separated and used. In this activity, you will simulate how batches of different petroleum products are shipped through a pipeline.

A. Tools and materials

- 1. 2 35 cc injectors
- 2. 1 Two port aquarium valve
- 3. 3 Pieces of clear, flexible plastic tubing, aquarium air line (two short pieces, one long piece)
- 4. 3 glass jars, small
- 5. Motor oil
- 6. Kerosene

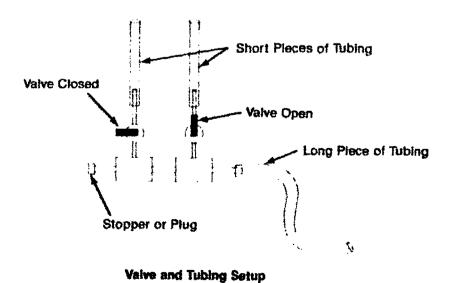

SAFETY NOTE: Follow all rules of good safety!

B. Procedure

(NOTE: Pump two batches of liquid through a line and separate the pumped liquids into three separate storage tanks: one with pure motor oil, one with intermixed motor oil and kerosene, and one with pure kerosene.)

1. Set up the valve and tubing as shown in Figure 1.

FIGURE 1

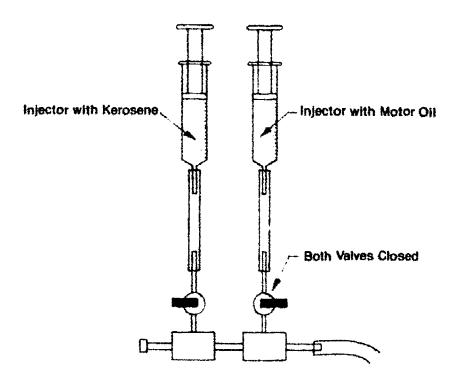

JOB SHEET #1

- 2. Fill one injector with 35 cc of motor oil.
- 3. Fill the other injector with 35 cc of kerosene.
- 4. Close both valves.
- 5. Connect each injector, carefully, to one of the short pieces of tubing as shown in Figure 2.

FIGURE 2

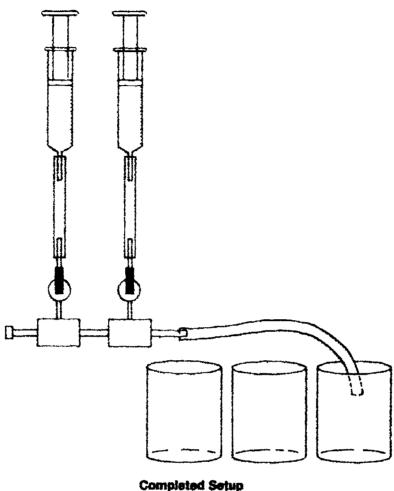

Connecting the injectors

JOB SHEET #1

6. Complete setup as shown in Figure 3.

- 7. Place the open end of the long tube (pipeline) into the first jar.
- 8. Open the valve below the injector containing the motor oil.
- 9. Push down the plunger on the injector.
- 10. Close the valve when the plunger is as far down as it will go.
- 11. Open the valve below the injector containing kerosene.
- 12. Push down the plunger on the injector.

(CAUTION: Closely watch the material flowing through the tube.)

- 13. Move the tube from the first jar into the second jar, when the intermixed material reaches the end of the tube.
- 14. Switch the tube into the third jar as soon as you have pure kerosene flowing through the pipeline.

JOB SHEET #1

15.	Obs	erve the materials in the jars and answer the questions:
	(NO [*]	TE: Consider the entire amount of liquid — both motor oil and kerosene — as $\%$.)
	a.	Estimate the percentage of liquid that is pure motor oil (amount in the first jar).
	b.	Estimate the percentage that is pure kerosene (third jar).
	C.	Estimate the percentage that is intermixed material (second jar).
	d.	How long did it take for the material in the second jar to settle?
16,	Clea	n, disassemble, and put away the equipment.

 - 2) Monitoring load requirements in elevators and escalators
- 17. Evaluated to the satisfaction of the instructor
- 18. Performance skills evaluated to the satisfaction of the instructor

TRANSPORTATION TECHNICAL SUBSYSTEMS UNIT VI

UNIT OBJECTIVE

After completion of this unit, the student should be able to distinguish between the six technical subsystems and design and build a model racer. Competencies will be demonstrated by completing the assignment sheets, job sheet, and unit tests with a minimum of 85 percent.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- Match terms related to transportation technical subsystems with the correct definitions.
- 2. Match types of transportation technical subsystems with the correct descriptions.
- 3. Complete statements concerning the elements of propulsion.
- 4. Match types of suspension systems with the corrections.
- 5. Complete statements concerning types of control sy.
- 6. Distinguish between guidance systems.
- 7. List considerations of structural systems.
- 8. Complete statements concerning support systems.
- 9. Identify technical subsystems. (Assignment Sheet #1)
- Design a model racer. (Assignment Sheet #2)
- 11. Demonstrate the ability to build a model racer, (Job Sheet #1)

TRANSPORTATION TECHNICAL SUBSYSTEMS UNIT VI

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Provide students with objective sheet.
- C. Discuss unit and specific objectives.
- D. Provide students with information and assignment sheets.
- E. Discuss information and assignment sheets.
- E Provide students with job sheet.
- G. Discuss and demonstrate the procedure outlined in the job sheet.
- H. Integrate the following activities throughout the teaching of this unit:
 - 1. Have students participate in the student organization activity to build 1/10 scale radio-controlled cars.
 - 2. Have students compare the technical subsystems of the automobile and the bicycle for similarities and differences.
 - 3. Discuss the authority and responsibilities of the many state and federal regulatory agencies for transportation.

Examples: FAA, ICC, FRA

- 4. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.
- Give test.
- J. Evaluate test.
- K. Reteach if necessary.

TRANSPORTATION TECHNICAL SUBSYSTEMS UNIT VI

INFORMATION SHEET

Terms and definitions

- A. Guidance Directing a body's course of travel
- B. Guideways Pathways for transportation vehicles
- C. Linear induction A magnetic coil is attached to the vehicle and the "rotor" becomes the rails along which the train moves
- D. MagLev train Magnetically levitated system where a magnetic force lifts the train above the track and then pushes it forward by another power source
- E. Propulsion Moving a body forward
- F. Suspension Support of a framework

II. Types of transportation technical subsystems (Transparency 1)

- A. Propulsion Process of causing a body to move by exerting a natural or mechanical force
- B. Suspension Methods employed to suspend a vehicle in or on a given environmental medium
- C. Control Mechanical or automated procedures used to control a vehicle and/or vehicular system
- D. Guidance Information required to operate a vehicle or vehicular system in a prescribed path
- E. Structure Structural makeup and design of vehicles and other systems' physical components
- F. Support -- Operation, maintenance, and regulation of total system

iii. Elements of propulsion (Transparency 2)

(NOTE: These elements work as a system to propel the transportation vehicle.)

- A. Energy sources Chemical, electrical, heat, light, nuclear, mechanical
- B. Energy converters Internal and external combustion engines, generators, motors
- C. Power converters and transmitters
 - Mechanical power Uses gears, belts, chains, and pulleys to transmit power

INFORMATION SHEET

- 2. Fluid power Uses pressurized gases or liquids to transmit power through tubes and hoses
- 3. Electrical power Uses conducting wires or air and electrical control devices to transmit power

IV. Types of suspension systems (Transparency 3)

A. Mechanical suspension — Uses mechanical devices for suspension

Examples: Wheels on rails, wheels on highways

B. Magnetic suspension — Uses permanent magnets or electromagnets for suspension

Example: MagLev Train

C. Fluid suspension — Uses air (aero) or water (hydro) systems for suspension

Examples: Hydrofoils, airplanes, hot air balloons

- 1. Aerostatic Force exerted when gases are in equilibrium
- 2. Hydrostatic Force exerted when liquids are in equilibrium
- 3. Hydrodynamic Force exerted by liquids in motion
- 4. Aerodynamic Forces exerted by gases in motion

V. Types of control systems (Transparancy 4)

A. Vehicular controls

- 1. On-off (arresting) control devices Examples include brakes, air flaps, and on-off switches.
- 2. Direction, force, and speed control devices Examples include rudders, steering wheels, accelerators, and electronic monitors.

B. System controls

- On-off control devices Examples include clutches and brakes on mechanical systems, gate and globe valves on fluid systems, and switches on electrical systems.
- Direction, force, and speed control devices Examples include gears and pulleys on mechanical systems, check valves and control/ relief valves on fluid systems, and diodes, fuses, and transformers on electrical systems.

(NOTE: Control devices may be manually or electronically activated from either local or remote locations.)

INFORMATION SHEET

VI. Guidance systems (Transparency 5)

- A. Physical guideways Highways, rails, tubes, canals, and cables
- B. On-board and external guidance devices and systems Includes sensing devices, coding systems, signals, transmitting and receiving systems, and storage and retrieval systems.
 - 1. On-board Examples include radios, speedometers, gauges, electronic sensors, automatic pilot, radar, and computers.
 - External guidance Examples include traffic lights, highway signs, water navigation markers, railroad signals, radar, and computers.

VII. Structural systems (Transparency 6)

A. Structure of vehicle

1. Materials used for constructing vehicle

Examples: Steel, aluminum, fiberglass

2. Methods of constructing vehicle

Examples: Welding, riveting, molding, forging

3. Design considerations

Examples: Purpose of vehicle, performance, safety, cost

B. Structure of guideways

1. Materials used for constructing guideways

Examples: Steel, concrete

Methods of constructing guideways

Examples: Pouring concrete, welding, riveting

3. Design considerations

Examples: Purpose of guideway, environmental impact, safety,

cost

INFORMATION SHEET

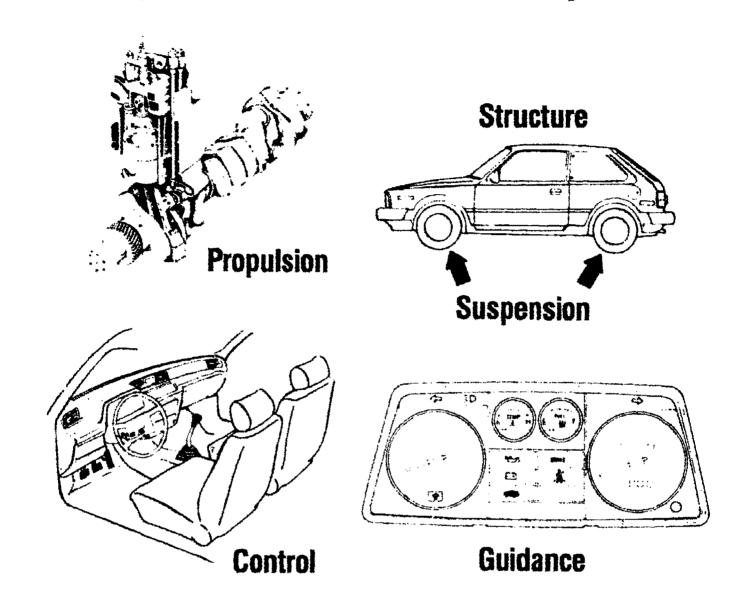

VIII. Support systems (Transparency 7)

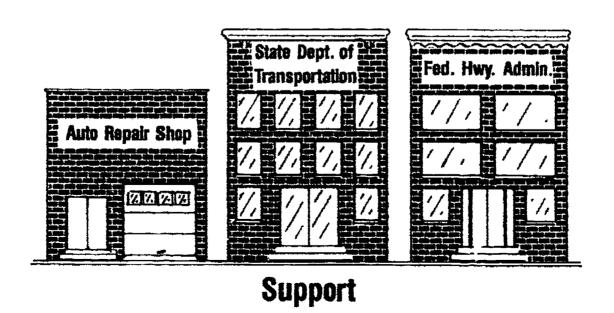

- A. Physical service and maintenance facilities
 - 1. Terminals
 - 2. Repair shops
 - 3. Loading/unloading docks
- B. Personnel All employees involved in transportation industries including management and support personnel
- C. Regulations All state and federal regulatory agencies which issue the licenses and enforce the laws and regulations of transportation industries

Examples: Federal Aviation Administration (FAA), department of transportation (state and federal), U.S. Coast Guard, Army Corps of Engineers, Civil Aeronautics Board, Interstate Commerce Commission, Federal Highway Administration, Federal Railroad Administration

TRANSPORTATION TECHNICAL SUBSYSTEMS UNIT VI

ASSIGNMENT SHEET #1 - IDENTIFY TECHNICAL SUBSYSTEMS

NAME	SCORE
Direction cle.	s: Choose a vehicle system and identify the technical subsystems used by that vehi
Vehicle S	ystem:
1.	Propulsion system (What are the energy sources used and how are they converted to power and transmitted?)
2.	Suspension system (What type of suspension system is used, what parts are involved?)
3.	Control system (What control devices are used in the vehicle and what control devices are used for the overall system?)
4.	Guidance system (What devices are used for physical, on-board, and external
	guidance?)

ASSIGNMENT SHEET #1

5.	Structural system (What materials and methods were used to construct the vehi- cle and the guideways?)				
6.	Support system (What facilities, personnel, and regulations are used to support the vehicle system?				

TRANSPORTATION TECHNICAL SUBSYSTEMS UNIT VI

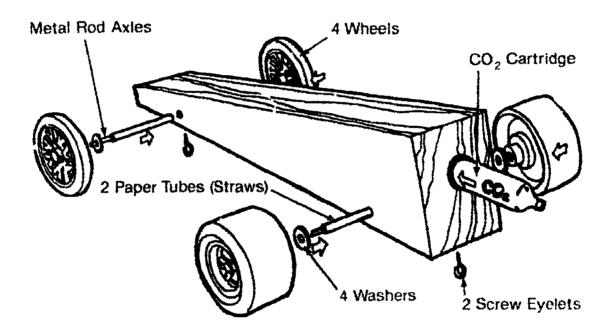

ASSIGNMENT SHEET #2 - DESIGN A MODEL RACER

NAME	SCORE
VAIVIE	300nc

Directions: Design a model racer using the specifications on the attached sheet for maximum and minimum dimensions.

(NOTE: This would be the appropriate time to decide whether to obtain a kit form or to do the complete process.)

- 1. Design the rough sketch.
- 2. Draw the final sketch.
- 3. Check for correct specifications.

ASSIGNMENT SHEET #2

Race Car Specifications

- Maximum dimensions for Body Blank,
 - Length 305 mm.
 - Front height 20 mm. Rear height 70 mm. B.
 - C.
 - D. Bottom to centerline of power plant chamber — 35 mm.
 - E. Width - 42 mm.
 - Power Plant Chamber 20 mm diameter, F. 51 mm depth, and drilled parallel to bottom surface. A minimum of 3 mm thickness around power plant housing must be maintained on all race cars for safety purposes. The position of the power plant must be as shown in the drawing.
 - The body of the model shall be one piece all-wood construction, and no parts G. (such as body strengtheners, fenders, plastic canopy, exhausts, or air folls) may be attached to or enclosed within the race cars. Bearings and lubricants may be used in construction.

2. Related dimensions¹.

	Maxi	mum	Mini	mum
Axles (diam.)	3	mm	3	mm
Axles (length)	70	mm		mm
Axles Bearing (diam.)		mm		mm

TRANSPORTATION TECHNICAL SUBSYSTEMS UNIT V!

JOB SHEET #1 - BUILD A MODEL RACER

A. Tools and materials

- 1. Wood block (15/8" x 23/4" x 12") or (42 mm x 70 mm x 300 mm)
- 2. Templates and carbon paper
- 3. Pencil
- 4. Masking tape
- 5. Rubber bands
- 6. 1 half round cabinet file
- 7. Coarse, medium, and fine sandpaper
- 8. Pliers
- 9. Scratch awl
- 10. 3/16" twist bit
- 11. Half round wood rasp
- 12. C-clamps
- 13. Hand drill or drill press*
- 14. Scroll saw, coping saw, or bandsaw*

(NOTE: *If power tools are used, have your teacher explain the proper and safe use before going any further. BE CAREFUL and FOLLOW SAFETY PRECAUTIONS!)

15. 3/4" spade bit

(NOTE: Entire kit may be purchased from Pitsco, Inc., Box 1328, Pittsburg, KS 66762.)

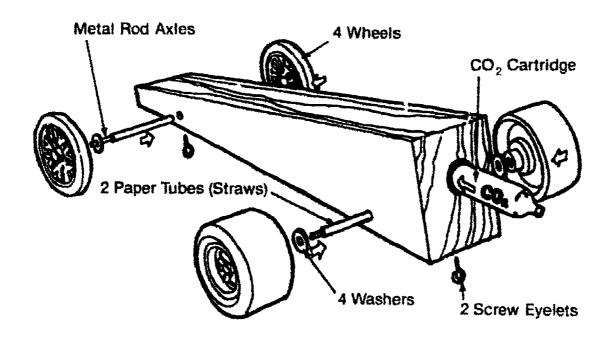

- 16. Screw eyes (2)
- 17. Straw tubes
- 18. Washers (4)
- 19. Plastic wheels (2 from, 2 rear)

JOB SHEET #1

20. Axles (Two 1/s" metal rod axles)

FIGURE 1

B. Procedure

- 1. Complete Assignment Sheet #2 on designing the racer.
- 2. Make a rough sketch showing two views of your car.
- 3. Using a grid sheet, draw a full scale model of your car (top and side).

(NOTE: Students should check drawings at this point for the following:

- Is the front axie in the correct position?
- ☐ Is rear axle in the correct position?
- ☐ Is there sufficient room for CO ₂ cartridge to fit in correct position?
- Does design fit within the height, width, and length dimensions allowed in Assignment Sheet #2?
- 4. Place drawing and carbon paper together and cut out drawing and carbon paper with scissors.

(NOTE: These are templates or pattern pieces.)

- 5. Tape side-view template onto wooden block and trace around template with pencil; remove template.
- 6. Tape the top-view template to the bottom of the block and trace around template with pencil; remove template.

- 7. Mark axie locations.
- 8. Drill axle holes.

(NOTE: Check limitations for correct position. Have instructor's approval before using any power equipment!)

9. Drill hole for CO₂ engine cartridge.

(NOTE: Check limitation guides for exact placement.)

- 10. Cut the patterns using coping saw or bandsaw.
- 11. Shape the top view using wood rasp and a file.
- 12. Smooth body by sanding.

(NOTE: First use coarse (60 grit) sandpaper, then medium sandpaper (100 grit).)

- 13. Cut and install soda straw bearings.
- 14. Place washers in position.
- 15. Force wheels on axles.
- 16. Check wheels for secure attachment and to see that axles turn freely.
- 17. Determine exact location of screw eyes (see Figure 1).
- 18. Make holes using a scratch awi. Use pilers to insert and tighten screw eyes.
- 19. Look through screw eyes to check for interference.
- 20. Sand and smooth body (starting with 150 grit and finishing with 220 grit, after removing wheels, axles, and screw eyes).
- 21. When car feels smooth, paint with a fast drying spray paint, at least two coats.

(NOTE: Car should be placed on a dowel rod, inserted in engine hole to allow free access.)

- 22. Check paint for flaws, and make repairs if needed.
- 23. Place decals and numerals in proper place.
- 24. Reinsert wheels, axles, and screw eyes.

(NOTE: Check wheels for flaws. Use fine sandpaper to smooth any bumps or irregularities. Graphite may be rubbed along axle to allow faster turning.)

25. Test car.

 - 11. Performance skills evaluated to the satisfaction of the instructor

UNIT OBJECTIVE

After completion of this unit, the student should be able to discuss types of pollution from various energy sources, list ways to control pollution and conserve energy, and construct a model magley train. Competencies will be demonstrated by completing the assignment sheets, job sheet, and unit tests with a minimum of 85 percent.

SPECIFIC OBJECTIVES

After completion of this unit, the student should be able to:

- 1. Match terms related to future projections and environmental impact of energy and transportation with the correct definitions.
- 2. Match types of pollution with the correct descriptions.
- 3. Complete statements concerning pollution from fossil fuels.
- 4. Match other energy sources with their correct pollutions and environmental impacts.
- 5. List ways to control pollution.
- 6. List energy conservation measures for areas of use.
- 7. Match emerging transmission systems with the correct descriptions.
- 8. Complete statements concerning advances in transportation.
- 9. Research trends in energy usage. (Assignment Sheet #1)

OBJECTIVE SHEET

- 10. Write a scenario of energy use in the year 2500. (Assignment Sheet #2)
- 11. Discuss the effect of a total absence of fossil fuels. (Assignment Sheet #3)
- 12. Demonstrate the ability to construct a model maglev train. (Job Sheet #1)

SUGGESTED ACTIVITIES

A. Obtain additional materials and/or invite resource people to class to supplement/reinforce information provided in this unit of instruction.

(NOTE: This activity should be completed prior to the teaching of this unit.)

- B. Make transparencies from the transparency masters included in this unit.
- C. Provide students with objective sheet.
- D. Discuss unit and specific objectives.
- E. Provide students with information and assignment sheets.
- E Discuss information and assignment sheets.
- G. Provide students with job sheet.
- H. Discuss and demonstrate the procedure outlined in the job sheet.
- 1. Integrate the following activities throughout the teaching of this unit:
 - 1. Do a low cost learning activity in Transportation Technology, "Technology Activities, Idea Book 1"; ITEA, Reston, VA; 1986; pp. 42-44.
 - 2. Discuss any environmental problems in your community and what can be done to prevent them in the future or lessen their effects.
 - 3. Contact state and national departments of energy and transportation for available materials on future projections and environmental impact of energy.
 - 4. Use local media to discuss trends affecting the environment.
 - 5. Discuss changes in cars to conserve energy and meet government regulations.
 - 6. Meet individually with students to evaluate their progress through this unit of instruction, and indicate to them possible areas for improvement.
- J. Give test.
- K. Evaluate test.
- L. Reteach if necessary.

INFORMATION SHEET

I. Terms and definitions

- A. Acid rain Rain containing sulfuric acid resulting from a combination of water vapor and sulfur oxides released by fossil fuel combustion
- B. Combustion The chemical process of burning which releases heat, light, and chemical by-products

(NOTE: Each time a fuel is burned in a combustion process, some type of pollutant is released into the air.)

- C. Conservation Efficient use of energy with minimal waste
- D. Cryogenics Science dealing with the properties of materials at extremely low temperatures
- E. Ecology Science concerned with interrelationship between fiving organisms (plants, animals, humans) and their environments
- F. Environment The circumstances, objects, and conditions that surround an organism
- G. Greenhouse effect Warming of the earth's surface caused by solar radiation passing through the earth's atmosphere and then being trapped by air particles and water vapor so that the heat builds up like in a greenhouse

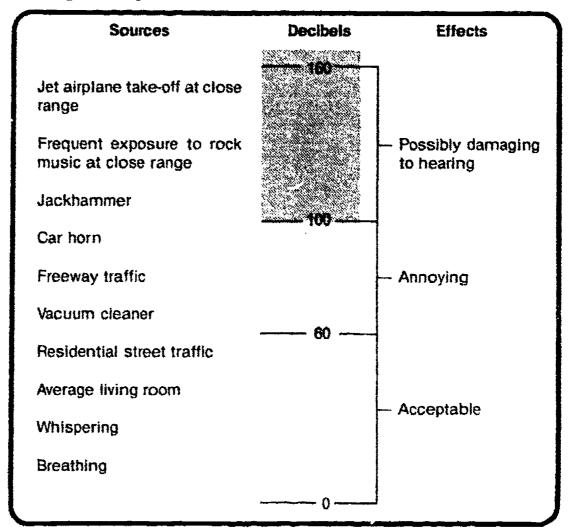

- H. Heavy metal poisoning Contamination from primarily mercury and lead which are highly poisonous and can affect the human nervous system
- Hydrocarbons Organic compounds often occurring in petroleum, natural gas, coal, and bitumens
- J. Jet lag A disruption of body rhythms caused by high speed jet travel
- K. Particulates Tiny particles of solid or liquid matter
- L. Pollutant Something that contaminates the environment
- M. Pollution Any undesirable change in the air, land, or water that harmfully affects living things
- N. Smog Dense, brownish-yellow mass of air resulting from a combination of sunlight, hydrocarbons, and nitrogen oxides given off by automobile engines
- O. Thermal inversion Occurs when a layer of warm air settles over a layer of cooler air that lies near the ground; the warm air holds down the cool air and prevents pollutants from rising and scattering

II. Types of pollution (Transparency 1)

- A. Air pollution Comes from all combustion processes such as furnaces in factories and homes, vehicle engines, and the burning of trash and wood
- B. Water pollution Comes from industrial chemical wastes, runoff from fertilizers and pesticides, animal wastes, and human sewage
- C. Land pollution Comes from overuse of farm lands which exhaust the soils' nutrients, erosion from careless farming or land development, and solid wastes from human trash and litter
- D. Other types of pollution
 - Radiation Comes from sunlight, nuclear weapons and waste products, and some electronic devices; exposure to large amounts of radiation can cause cancer and death; scientists are studying the effects of smaller exposures
 - Thermal pollution The addition of heated water to a body of water; this is primarily from industries and power plants and can kill animals and plants that are used to living at lower temperatures

Noise pollution — Loud sounds such as from jet engines, jackhammers, and vehicle engines cause discomfort in people and can damage hearing

III. Pollution from fossil fuels

(NOTE: Most sources of controlled energy produce pollution although some sources of pollution are worse than others. Pollution from fossil fuels is among the worst.)

- A. Air pollution (Transparency 2)
 - 1. Smog
 - a. Forms when sunlight hits the hydrocarbons and nitrogen oxides given off by automobile engines
 - Makes breathing difficult, irritates eyes, and can injure lungs as well as damage plants

2. Carbon monoxide

- a. Produced by automobile engines
- b. Reduces the oxygen-carrying capacity of the blood; causes headaches and dizziness and can be fatal in large amounts
- 3. Particulates Dust, smoke, fumes, ash, and other materials such as lead particles given off by fossil fuel combustion
- 4. Earth warming Fossil fuel combustion gives off excess carbon dioxide which warms the atmosphere.

(NOTE: Too much warming of the earth could seriously change the present climates of the earth.)

B. Water pollution - Primarily acid rain

- When coal and oil are burned, they release sulfur oxides into the air. When these sulfur oxides mix with water vapor in the air, the result is sulfuric acid. When it rains, the acid drops to earth.
- 2. It is very harmful to all forms of life. The most noticeable effects now are reduced fish populations.
- C. Thermal pollution Power plants release waste heat into rivers, lakes, and the oceans which changes the environments for the existing fish there. Many fish cannot survive these changes.

IV. Pollution and environmental impact from other sources of energy

A. Wood — Peleases unburned chemical compounds and small burned particles (soot and other particles) which are harmful when inhaled

(NOTE: Wood is even more polluting than fossil fuels.)

- B. Geothermal energy Releases hydrogen sulfide gas into the air which results in acid rain
- C. Hydroelectric energy Produces no pollution but the damming of rivers changes natural biological systems such as animal habitats
- D. Nuclear energy Main pollution is the radioactive waste which must be handled with great care; nuclear accidents in nuclear plants can cause very severe pollution which can have long term effects on the environment

V. Ways to control pollution

- A. Develop more pollution-free energy sources.
- B. Reduce pollution at source.

Examples: Emission-control devices on automobiles, filters added to power plant smoke stacks

C. Reduce use of energy through conservation.

(NOTE: Using less energy will create less pollution.)

VI. Energy conservation measures for areas of use

- A. Home energy use
 - 1. Use energy-efficient appliances.
 - 2. Close up cracks around doors, windows, and foundations.
 - 3. Provide adequate insulation in walls, ceilings, and foundations,
 - 4. Reduce heating and cooling temperatures in home.
 - 5. Develop energy-conservation habits.

Examples: Turn off lights and appliances when not needed, use washing machine and dishwasher only when fully loaded, fix leaky faucets

- 6. Recycle materials. (Aluminum, glass, paper)
- B. Business and Industrial use
 - 1. Close up cracks around doors, windows, and foundations.
 - 2. Provide adequate insulation.
 - 3. Reduce thermostats.
 - 4. Improve efficiency of machines and processes used by industry.
 - 5. Recover heat previously lost through smoke stacks and exhaust systems.
 - 6. Recycle products and resources.
 - Stagger demand. Change usage so all people do not want it at the same time.

C. Transportation use

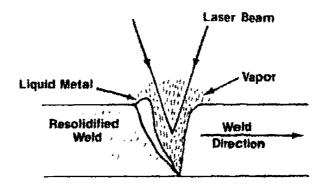

- 1. Carpool to work or school.
- 2. Plan trips using most direct and efficient routes.
- Use modes of transportation other than personal automobile all the time. Use public transportation (mass transit) when possible. Walk and ride bicycles as much as possible.

- 4. Improve driving habits. Avoid sudden starts and stops.
- 5. Drive automobiles with smaller, more fuel-efficient engines.

VII. Emerging transmission systems

A. Lasers — Concentrated short electromagnetic wavelengths used in industry, medicine, and research for drilling, welding, cutting, and burning

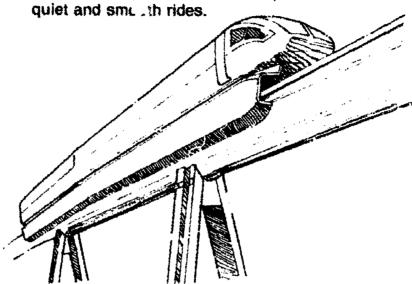

- B. Fiberoptics Hair-thin strands of flexible glass used to carry communication messages
- Cryogenics Super cooling to prepare freeze-dried foods and to produce super-efficient generators and superconductors for more efficient transmission of electricity

VIII. Advances in transportation

A. Rail transportation

1. Applying cryogenics to traditional rail transport, Magley (magnetically levitated) trains can reach speeds of over 300 mph and provide quiet and smy thirdes.

- 2. Computerized rail classification yards
- 3. Computerized people-moving systems (mass transit)

B. Highway transportation

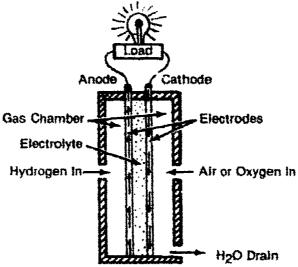

- 1. Engines that burn methanol and synfuels
- 2. Engines that use hydrogen as a fuel
- 3. Electric vehicles powered by batteries
- 4. Electronic control systems

C. Air transportation

- 1. Propfar design
 - a. Has 8 to 10 shorter propeller blades that turn faster than regular blades.
 - b. Will use 20% less fuel.

- 2. Canard design
 - a. Wings are at or near the end of the aircraft.
 - b. Are light, fast, fuel-efficient, and safe.
- 3. Fuel cells Produce electricity from a chemical reaction between hydrogen and oxygen

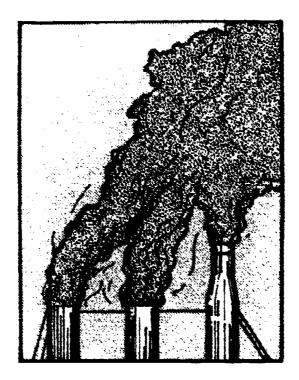

(NOTE: The space shuttle Columbia used fuel cells to provide electrical power during flight.)

 Composite materials — New materials are being used such as hexel honeycomb, a resin-coated, paperlike polymer covered with graphite fibers imbedded in epoxy.

(NOTE: This was used in the construction of the Voyager.)

Types of Pollution

Air Pollution

Water Pollution

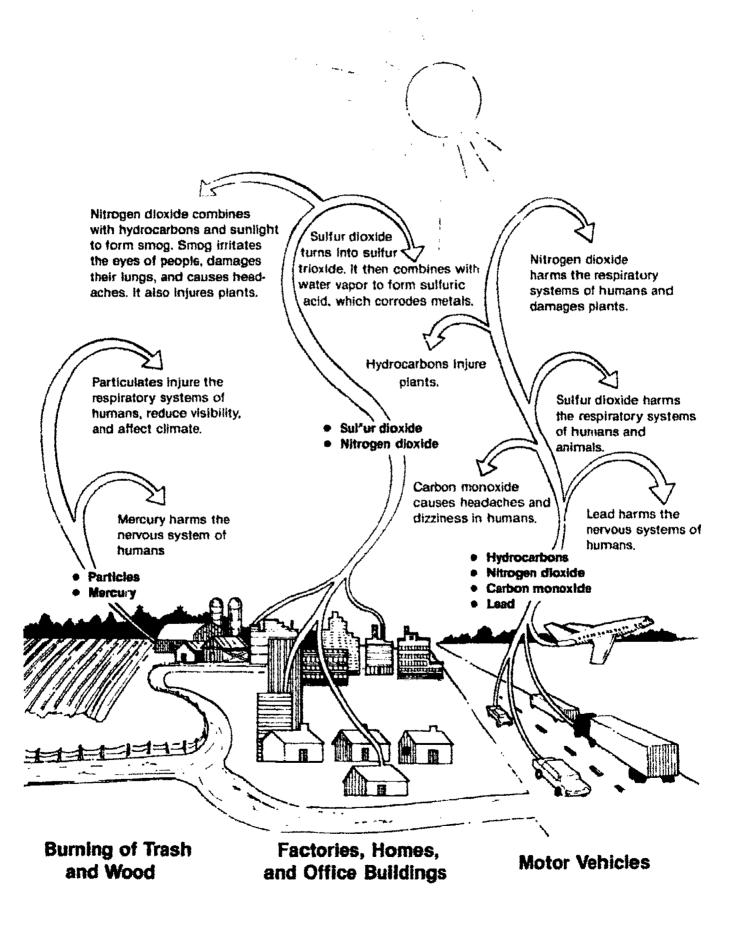

Land Pollution

Air Pollution

(Pollutants and Their Effects)

ASSIGNMENT SHEET #1 - RESEARCH TRENDS IN ENERGY USAGE

NAME	SCORE	

Directions: Using a current scientific magazine as a source, research and discuss trends in

energy usage for one source of energy (fossil fuels, nuclear energy, etc.).

ASSIGNMENT SHEET #2 — WRITE A SCENARIO OF ENERGY USE IN THE YEAR 2500

NAME	· · · · · · · · · · · · · · · · · · ·	SCORE

Directions: Using what we have covered in this unit and any outside resources, write a sce-

nario of how you think energy will be used in the year 2500.

ASSIGNMENT SHEET #3 — DISCUSS THE EFFECT OF A TOTAL ABSENCE OF FOSSIL FUELS

NAME	SCORE

Directions: Using what we have covered in this unit and any outside resources, discuss what would happen if there were no fossil fuels left in the world. How would this change your life?

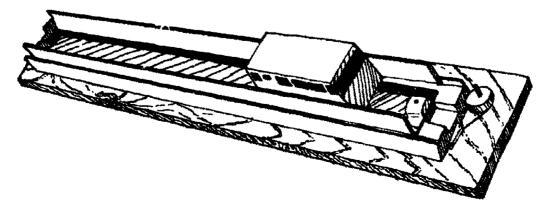

JOB SHEET #1 - CONSTRUCT A MODEL MAGLEV TRAIN

A. Tools and materials

- 1. 1 3/4" x 6" x 36" wood
- 2. $1 1^{1/2}$ " × 3" × 30" aluminum channel
- 3. $1 \frac{3}{4}$ " × $3\frac{1}{2}$ " × 32" wood
- 4. $2 \cdot \frac{5}{8}$ " x $1\frac{1}{4}$ " x 32" wood
- 5. 2-3/4" x 1" x 1" wood
- 6. 1 6" x 16" ABS thin plastic or balsa wood
- 7. $2 \frac{1}{2}$ × $\frac{3}{4}$ × 2* bar magnets
- 8. 8 .5 x .060" strip magnets, two poles on each side (12' divided into four 30" strips and four 6" strips)
- 9. 2 1" pulleys and axles
- 10. 1 Fine nylon cord, 6' long (fishing line)
- 11. $1 \frac{1}{2}$ × 2" spring
- 12. 1 1/s" welding rod, 6" long
- 13. Compass
- 14. Fasteners and adhesives
- 15. Tools as appropriate (Follow safety rules!)

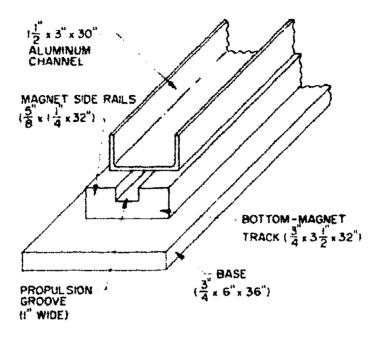

FIGURE 1

B. Procedure

1. Construct basic track assembly. End view is sixown in Figure 2.

FIGURE 2

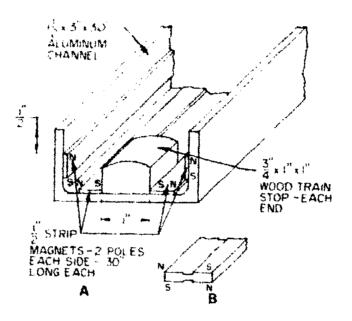

- a. Cut a 3/4" x 6" x 36" base.
- b. Cut a $\frac{3}{4}$ " x $3\frac{1}{2}$ " x 32" bottom track to carry the propulsion magnet.
- c. Center this on the base track and fasten.
- d. Cut two $\frac{5}{8}$ " \times $1\frac{1}{4}$ " \times 32" magnet side rails.
- e. Position as shown and fasten, leaving a 1" groove for the propulsion magnet.
- f. Center the $1^{1}/2^{n} \times 3^{n} \times 30^{n}$ aluminum channel on the side rails and fasten.

2. Examine Figure 3 making note of the locations of the strip magnets, their polarity, and the location of the train stops.

FIGURE 3

a. Cut strip magnets into 30" lengths.

(NOTE: These can be cut with scissors.)

- b. Use a compass to determine the polarity of the magnets; the compass' north pole with point to the magnets' south pole.
- c. Mark magnets with chalk.

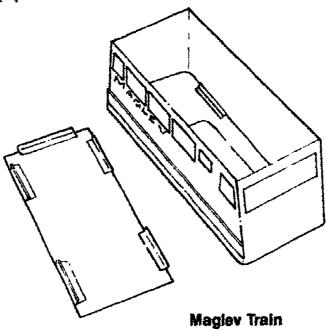

(NOTE: Poles may also be identified by placing magnets next to each other; like poles repel each other.)

- d. Glue magnetic strips in the channel according to the measurements and polarity shown in Figure 3.
- e. Form and fasten wooden train stops to each end of the aluminum channel.

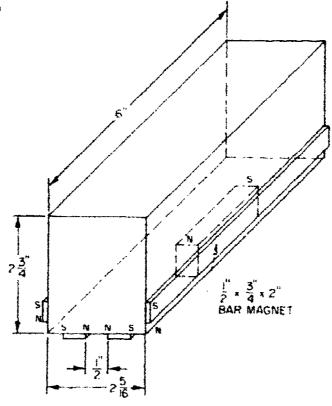

3. Build Maglev train as shown in Figures 4 and 5.

FIGURE 4

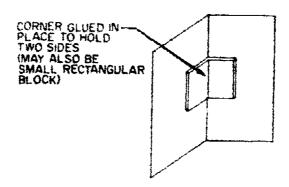

a. Cut the plastic or balsa wood to the dimensions shown in Figure 5. The critical dimension is the train width.

FIGURE 5

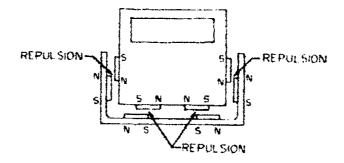

- b. Cut the plastic or balsa wood to provide the minimum clearance between the magnets on the train and those on the channel.
- c. Assemble the train using adhesive.
- d. Add corner pieces of plastic or wood to strengthen the train as shown in Figure 6.

FIGURE 6

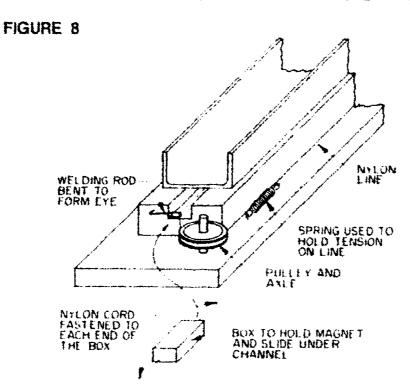

- e. Do not glue the top. It should be removable.
- f. Use the corner pieces as shown in Figure 4 to position the top.
- g. Cut four magnet strips, 6" long.
- h. Use a compass to determine the polarity.
- i. Glue magnets on the train positioning them as shown.
- j. Glue a $\frac{1}{2}$ " x $\frac{3}{4}$ " x 2" bar magnet in the train as shown in Figure 5.
- 4. Place the train in the track and check. It should be suspended in the air.
- 5. Check the polarity of the assembly as shown in Figure 7.

FIGURE 7

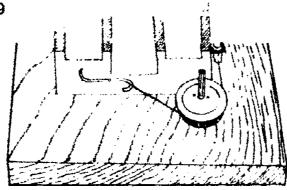

6. Assemble the propulsion system to the track. (Figure 8)

- a. Drill a hole at each end of the track.
- b. Mount the pulleys so that the nylon cord can travel through and along side the propulsion groove. (Figure 9)

- Assemble or find a small balsa wood or plastic box to hold the propulsion magnet. The box should just fit in the propulsion groove and hold the magnet.
- d. Place the magnet in the box.

- e. Drill small holes in each end of the box for attaching the nylon cord.
- f. Cut the cord into two pieces, each 3' long. Attach the pieces to the box, one on either end.
- g. Place the box in the propulsion groove.
- h. Position it so that the polarity is the same as that of the magnet in the train. The propulsion magnet must repel the train magnet to cause the train to move.
- Run the cords in opposite directions through the eyes and around the pulleys (Figure 9).
- Tie the cord ends to the ends of a spring which will maintain tension in the cord.
 - (NOTE: Another means of propelling this train is through the use of a rubber band and a plastic propeller.)
- 7. Test your train's propulsion by pulling the cord. As the propulsion magnet moves through the groove, it should repel the train magnet, causing the train to move down the track.

PRACTICAL TEST JOB SHEET #1 — CONSTRUCT A MODEL MAGLEV TRAIN

STUDENT'S NAME _____

Instructions: When you are ready to perform this task, ask your instructor to cedure and complete this form. All items tisted under "Process Evaluation" "Yes" for you to receive an overall performance evaluation. PROCESS EVALUATION (EVALUATOR NOTE: Place a check mark in the "Yes" or "No" blanks to designot the student has satisfactorily achieved each step in this procedure. I unable to achieve this competency, have the student review the materials at the student:	i" must i ignate wi	receive a
(EVALUATOR NOTE: Place a check mark in the "Yes" or "No" blanks to designot the student has satisfactorily achieved each step in this procedure. I unable to achieve this competency, have the student review the materials a	if the st	udent is
not the student has satisfactorily achieved each step in this procedure. I unable to achieve this competency, have the student review the materials at	if the st	udent is
The student:		gain.)
	YES	NO
 Cut strip magnets. Determined magnet polarity. Attached magnets to track assembly. Built Maglev train. Checked train and track for suspension. Assembled propulsion system. Tested train. Checked in/put away tools and materials. Cleaned the work area. Used proper tools correctly. 		
EVALUATOR'S COMMENTS:		

PRACTICAL TEST

PRODUCT EVALUATION

(EVALUATOR NOTE: Rate the student on the following criteria by circling the appropriate numbers. Each item must be rated at least a "3" for mastery to be demonstrated. (See performance evaluation key below.) If the student is unable to demonstrate mastery, student materials should be reviewed and another product must be submitted for evaluation.)

	4	3	2	1
Basic Track Assembly	Channel Centered Groove Correct Base OK	Aluminum Channel Too Long	Aluminum Channel Not Centered	Propulsion Groove Too Narrow! Too Wide
**************************************	4	3	2	1
Magnetic Suspension System	Polarity Correct/ Strips Correct Length	Reverse Magnet Polarity	Magnet Strips Too Long	Magnet Strips Too Short
	4	3	2	1
Maglev Train	Clearance Meets Minimum Specifications	Body Needs Reinforcement	Reposition Magnets/ Wrong Polarity	Clearance Exceeds Maximum Specifications
	4	3	2	1
Propulsion System	Clearance Meets Minimum Specifications	Cord Too Long Not Enough Tension	Cord Too Short, Too Much Tension	Propulsion 300 Too Wide/ Too Narrow

PERFORMANCE EVALUATION KEY

- 4 Skilled Can perform job with no additional training.
- 3 Moderately skilled Has performed job during training program; limited additional training may be required.
- 2 Limited skill Has performed job during training program; additional training is required to develop skill.
- 1 Unskilled Is familiar with process, but is unable to perform job.

(EVALUATOR NOTE: If an average score is needed to coincide with a competency profile, total the designated points in "Product Evaluation" and divide by the total number of criteria.)

		TEST	
1.	Match the	terms on the right with the correct definitions.	
	a.	Dense, brownish-yellow mass of air result-	1. Acid rain
		ing from a combination of sunlight, hydro- carbons, and nitrogen oxides given off by automobile engines	2. Combustion
		automoune ungmou	3. Conservation
	b.	The circumstances, objects, and conditions that surround an organism	4. Cryogenics
	c.	Something that contuminates the environ-	5. Ecology
	v.	ment	6. Environment
	d.	Efficient use of energy with minimal waste	7. Greenhouse effect
	e.	Science concerned with interrelationship between living organisms (plants, animals,	Heavy metal poisoning
		humans) and their environments	9. Hydrocarbon
	f.	Rain containing sulfuric acid resulting from a combination of water vapor and sulfur	10. Particulates
		oxides released by fossil fuel combustion	11. Pollutant
	g.	Tiny particles of solid or liquid matter	12. Radiation
	h.	Science dealing with the properties of mate-	13. Smog
		rials at extremely low temperatures	14. Thermal inversion
	i.	Occurs when a layer of warm air settles over a layer of cooler air that lies near the ground; the warm air holds down the cool air and prevents pollutants from rising and scatter- ing	
	j.	Contamination from primarily mercury and lead which are highly poisonous and can affect the human nervous system	
	k.	Warming of the earth's surface caused by solar radiation passing through the earth's atmosphere and then being trapped by air particles and water vapor so that the heat builds up	

	l.	The chemical process of burning which releases heat, light, and chemical by-products			
	m.	Organic compounds often occurring in petroleum, natural gas, coal, and bitumens			
2.	Match types of pollution on the right with the correct descriptions.				
	a.	Loud sounds such as from jet engines, jack- hammers, and vehicle engines cause dis- comfort in people and can damage hearing	1. Air pollution		
			2. Land pollution		
	b.	The addition of heated water to a body of water; this is primarily from industries and power plants and can kill animals and plants that are used to living at lower temperatures	3. Noise pollution		
			4. Radiation		
			5. Thermal pollution		
	c.	Comes from industrial chemical wastes, runoff from fertilizers and pesticides, animals wastes, and human sewage	6. Water pollution		
		Comes from all combustion processes such as furnaces in factories and homes, vehicle engines, and the burning of trash and wood			
	e.	Comes from overuse of farm lands which exhaust the soils' nutrients, erosion from careless farming or land development, and solid wastes from human trash and litter			
	f,	Comes from sunlight, nuclear weapons and waste products, and some electronic devices; exposure to large amounts of it can cause cancer and death			
3.	Complete st	tatements concerning pollution from fossil fu	els by circling the correc		

- t
 - Smog makes (thinking, breathing) difficult, irritates eyes, and can injure (heart, a. lungs) as well as damage plants.
 - b. Carbon monoxide (can, can not) be fatal in large amounts.
 - Carbon monoxide exposure causes (headaches, stomachaches). C.
 - d. Fossil fuel combustion gives off excess (sulfur dioxide, carbon dioxide) which warms the atmosphere.

Acid rain is (slightly, very) harmful to all forms of life.

e.

f,	The	most noticeable effects of acid rain are reduced	d (fish, human) populations.
	ch othe acts.	er energy sources on the right with the correct pe	ollutions and environmenta
	a.	Releases unburned chemical compounds and small burned particles (soot and other	1. Geothermal energy
		particles) which are harmful when inhaled	2. Wood
	b.	Releases hydrogen sulfide gas into the air which results in acid rain	3. Nuclear energy
	C.	Produces no pollution but the damming of	4. Hydroelectric energy
nia (Circ.)	U.	rivers changes natural biological systems such as animal habitats	
	d.	Main pollution is the radioactive waste which must be handled with great care; accidents can cause very severe pollution which can have long term effects on the environment	
	two wa	ays to control pollution.	
a.			
b.			
List	three e	energy conservation measures for each of the fo	ollowing areas:
a,	Hom	ne energy use	
	1)		
	2)		
	3)		
b.	Busi	ness and industrial use	
	1)		
	2)		
	3)		

	c. Transportation use					
	1)					
	2)					
	3)		·			
7.	Match eme	neir correct descriptions.				
	a.	Concentrated short electromagetic wave- lengths used in industry, medicine, and	1. Cryogenics			
		research for drilling, welding, cutting, and burning	2. Fiber optics			
	b.		3. Lasers			
	U,	Hair-thin strands of flexible glass used to carry communication messages	4. Robots			
	c.	Super coding to prepare freeze-dried foods and to produce super-efficient generators and superconductors for more efficient transmission of electricity				

- Complete the following statements concerning advances in transportation by circling the correct words.
 - a. An advancement in air transportation is the propfan design which has 8 to 10 shorter propeller biades that turn (slower, faster) than regular blades and will use (20%, 80%) less fuel.
 - b. The (Canary, Canard) design has wings at or near the end of the aircraft. This design is light, fast, fuel-efficient, and safe.
 - c. Applying (cybernetics, cryogenics) to traditional rail transport, Maglev trains can reach speeds of over 300 mph and provide quiet and smooth rides.
 - d. An advancement in highway transportation is engines that burn (methanoi, ethanoi), synfuels, and (hydrogen, oxygen).
 - e. An advancement in space transportation is the use of (battery, fuel) cells which produce electricity from a chemical reaction between hydrogen and oxygen.

(NOTE: If the following activities have not been accomplished prior to the test, ask your instructor when they should be completed.)

- 9. Research trends in energy usage. (Assignment Sheet #1)
- 10. Write a scenario of energy use in the year 2500. (Assignment Sheet #2)
- 11. Discuss the effect of a total absence of fossil fuels. (Assignment Sheet #3)
- 12. Demonstrate the ability to construct a model magley train. (Job Sheet #1)

ANSWERS TO TEST

- 1. a. 13 h. 6 14 b. i. 11 8 C. j. 7 d. 3 k. 5 2 e. 1. 9 f. 1 m. 10 g.
- 2. a. 3 d. 1 b. 5 e. 2 c. 6 f. 4
- 3. a. Breathing, lungs
 - b. Can
 - c. Headaches
 - d. Carbon dioxide
 - e. Very
 - f. Fish
- 4. a. 2
 - b. 1
 - c. 4
 - d. 3
- 5. Any two of the following:
 - a. Develop more pollution-free energy sources.
 - b. Reduce pollution at source.
 - c. Reduce use of energy through conservation.
- 6. Any three from each of the following:
 - a. Home energy use
 - 1) Use energy-efficient appliances.
 - 2) Close up cracks around doors, windows, and foundations.
 - 3) Provide adequate insulation in walls, ceilings, and foundations.
 - 4) Reduce heating and cooling temperatures in home.
 - 5) Develop energy-conservation habits.
 - 6) Recycle materials. (Aluminum, glass, paper)
 - b. Business and industrial use
 - 1) Close up cracks around doors, windows, and foundations.
 - 2) Provide adequate insulation.
 - 3) Reduce thermostats.
 - 4) Improve efficiency of machines and processes used by industry.
 - 5) Recover heat previously lost through smoke stacks and exhaust systems.
 - 6) Recycle products and resources.
 - 7) Stagger demand.

ANSWERS TO TEST

- c. Transportation use
 - 1) Carpool to work or school.
 - 2) Plan trips using most direct and efficient routes.
 - 3) Use modes of transportation other than personal automobile all the time. Use public transportation when possible. Walk and ride bicycles as much as possible.
 - 4) Improve driving habits. Avoid sudden starts and stops.
 - 5) Drive automobiles with smaller, more fuel-efficient engines.
- 7. a. 3
 - b. 2
 - c. 1
- 8. a. Faster, 20%
 - b. Canard
 - c. Cryogenics
 - d. Methanol, hydrogen
 - e. Fuel
- 9.-11. Evaluated to the satisfaction of the instructor
 - 12. Performance skills evaluated to the satisfaction of the instructor
